Mobile IP

Mobile IP terminology

Correspondent Node (CN)

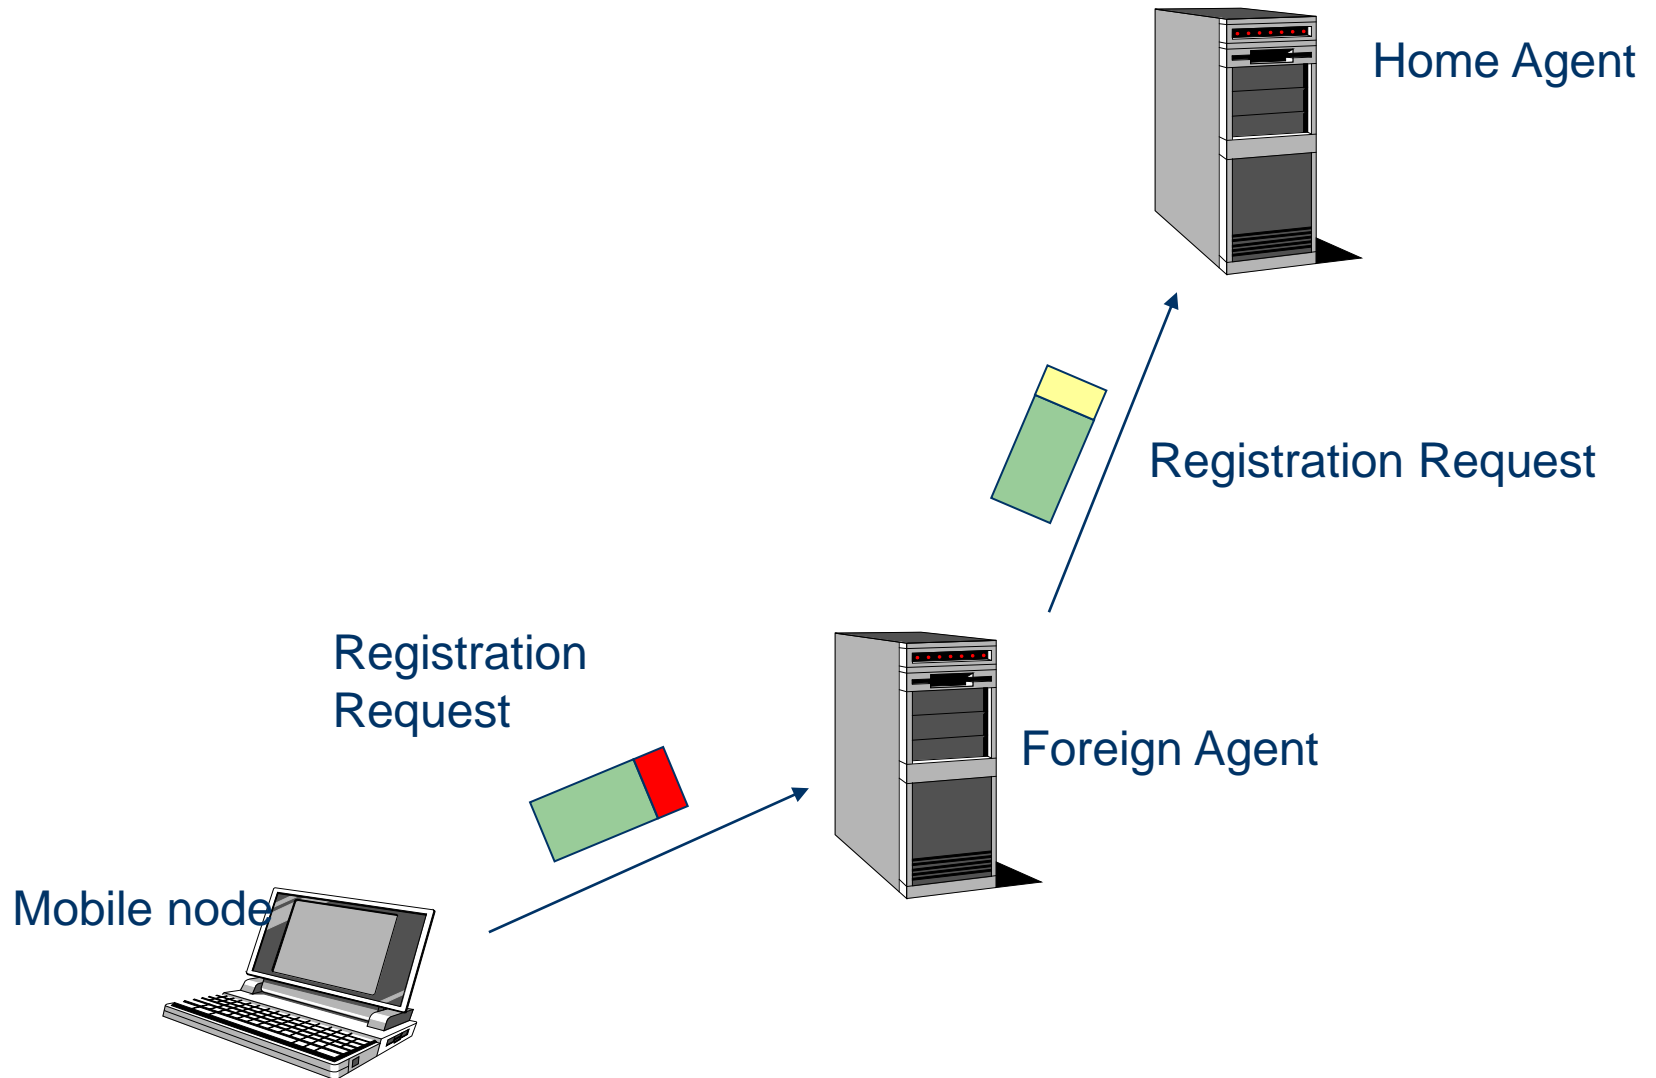

Home Agent (HA)

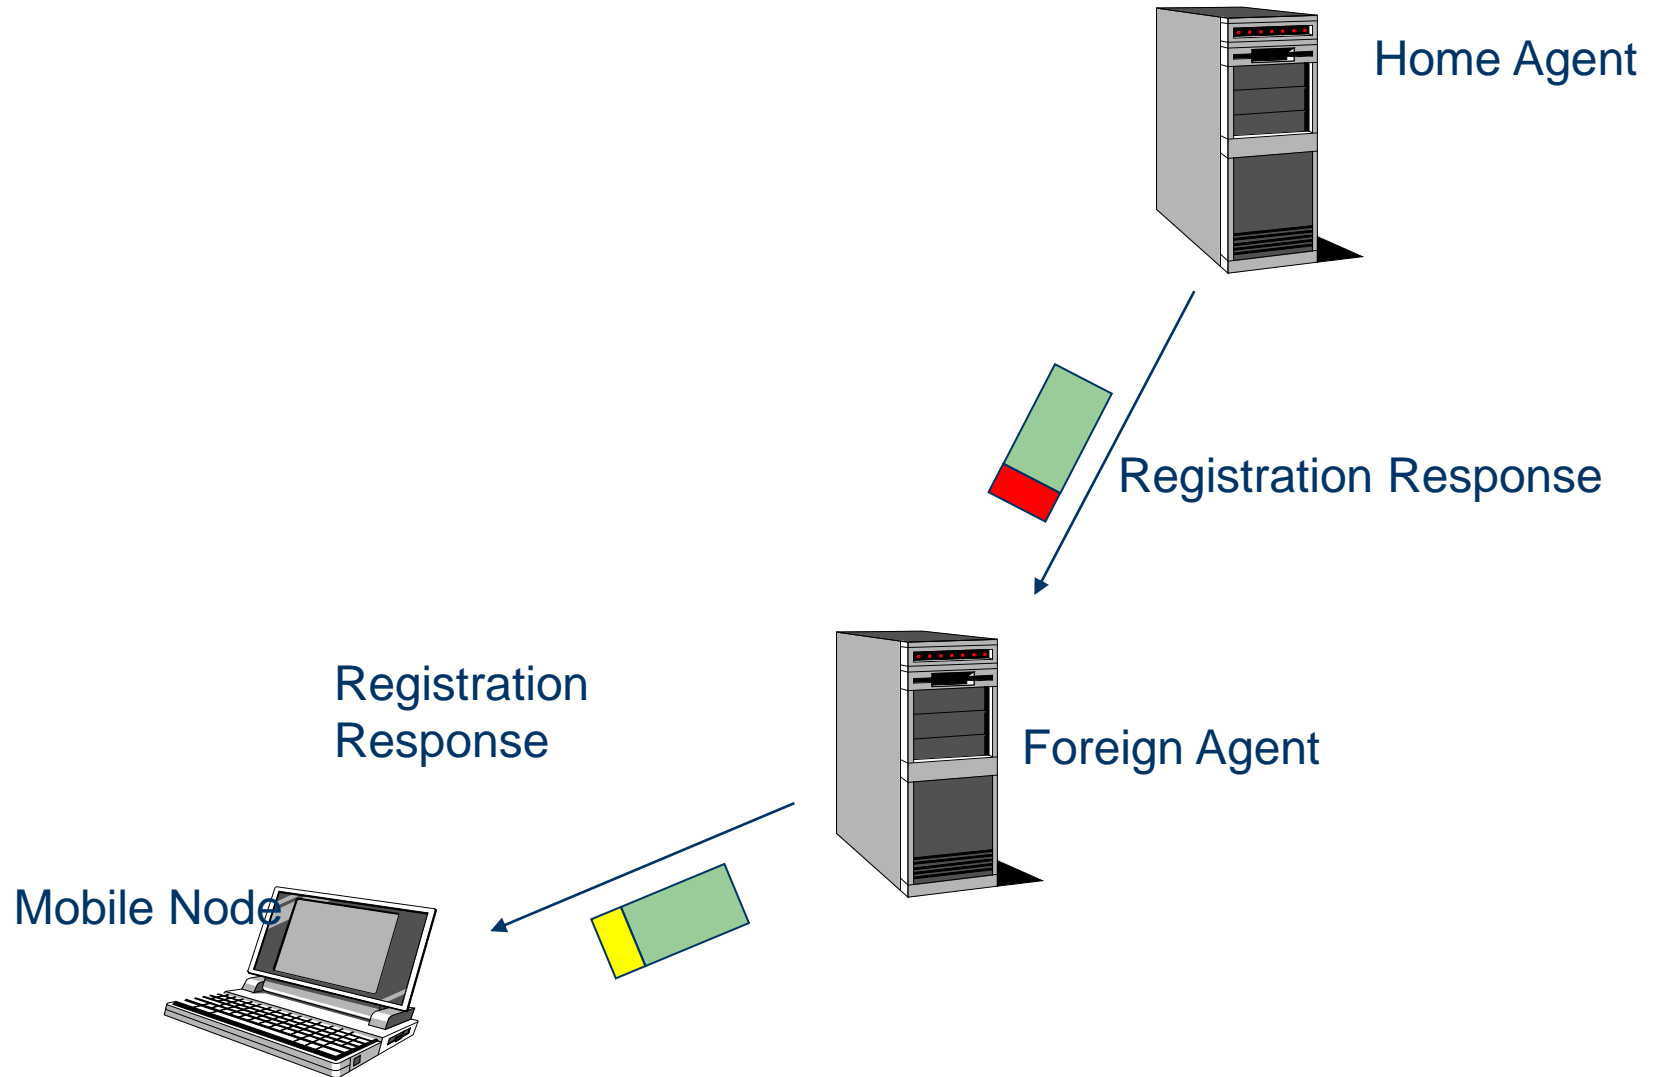

Foreign Agent (FA)

Mobile IP – Registration

Mobile IP – Registration

Mobile IP - Operation

IP-in-IP Tunneling

- IP packet is encapsulated into a new IP packet
 - Destination = care-of-address
 - Source = address of home agent
 - Data = original IP packet

Mobile IP drawbacks

- **Triangular routing**
 - Solution: Route optimization
- **Firewalls:** No direct reverse link possible
 - Solution: Reverse tunneling

Mobile IP – Route Optimization

Mobile IP – Reverse tunnel

Mobile IP – Reverse tunnel

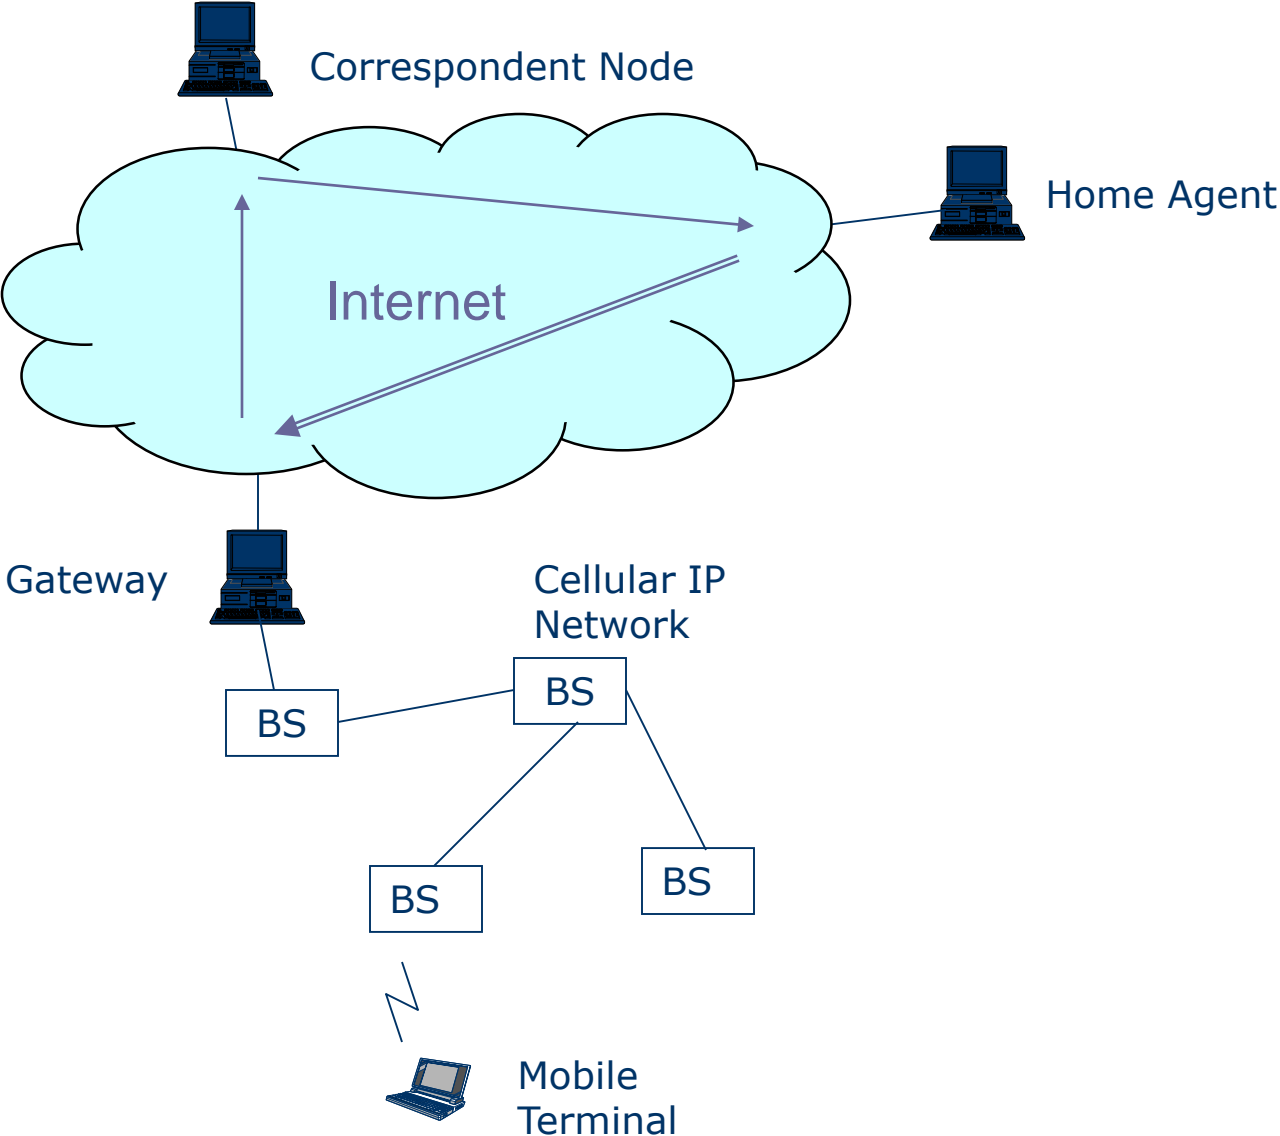

Mobile IP – Handover

Macro- and Micro- mobility

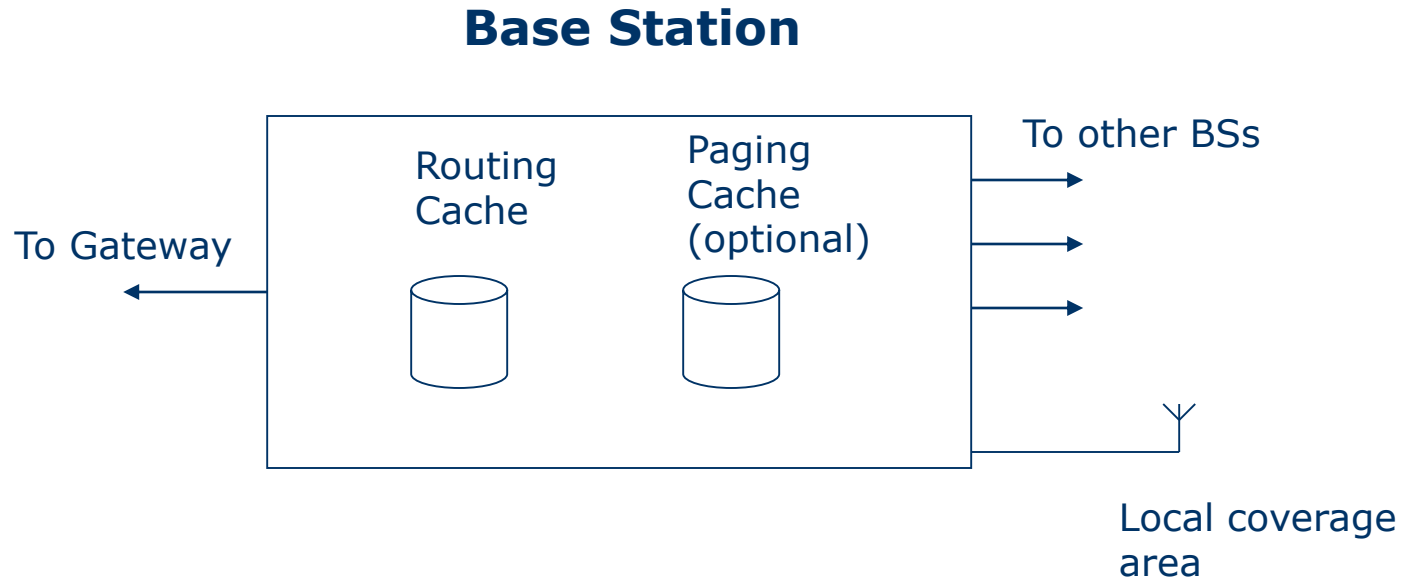

Cellular IP

(mobile) IP signaling

Cellular IP Signaling

Cellular IP

Routing Cache in all nodes

Paging Cache depends on design

■ BS with paging cache

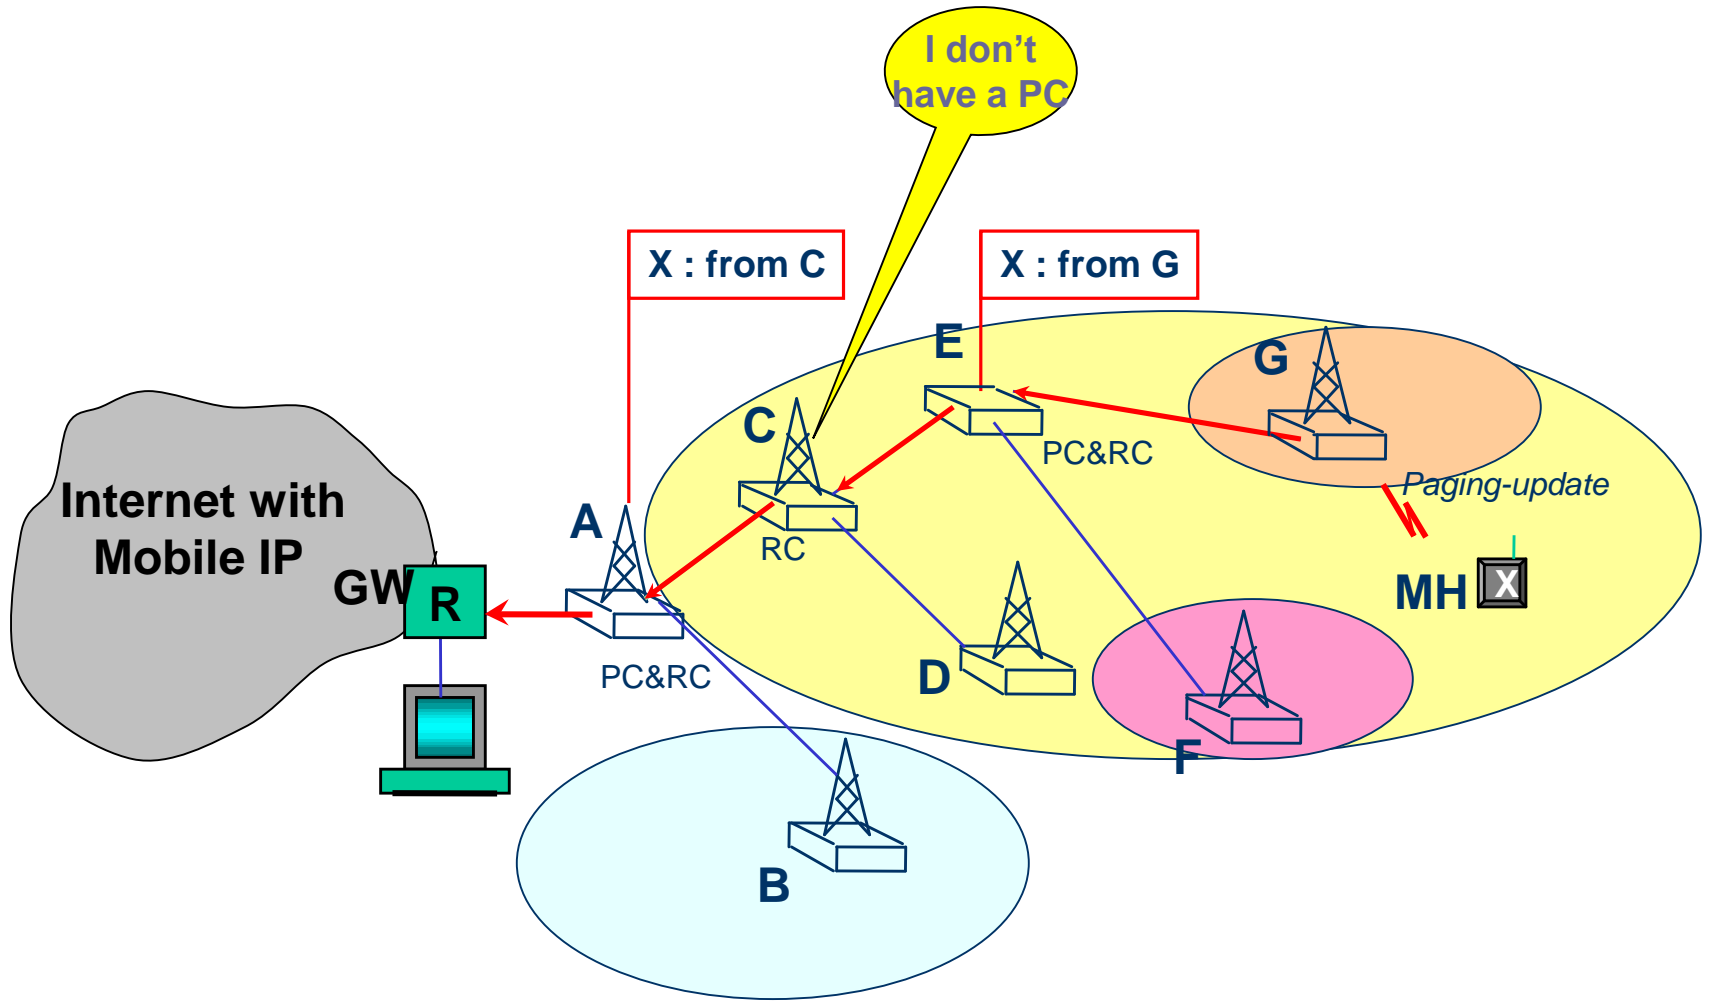

□ BS without paging cache

○ Paging areas

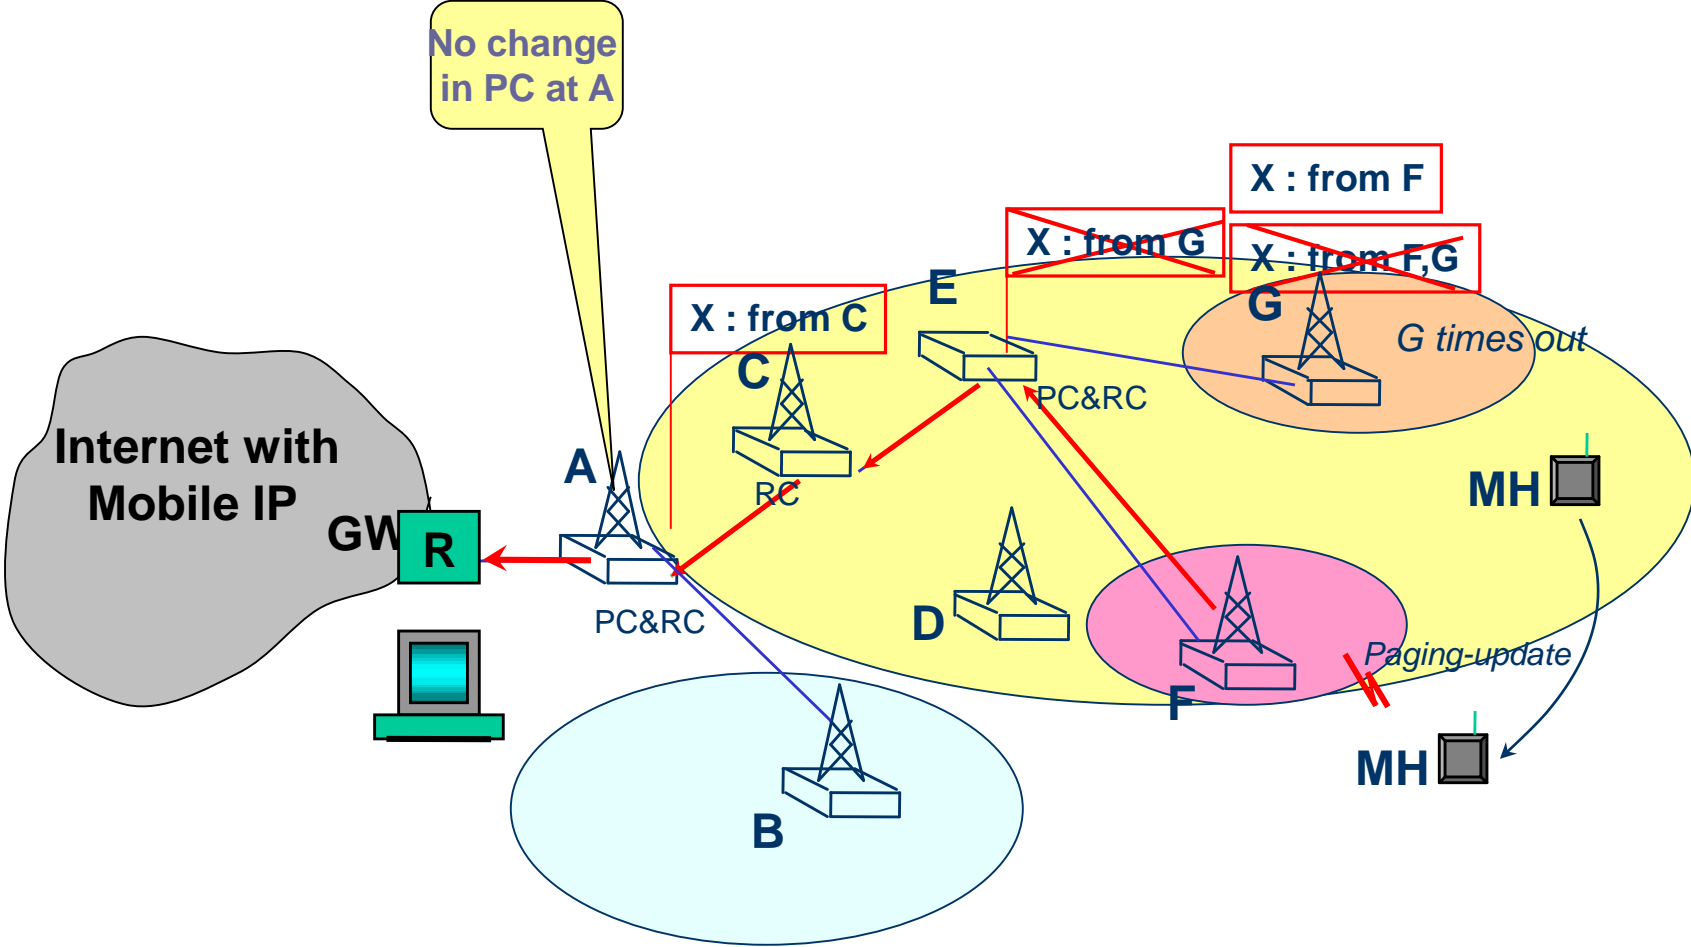

Cellular IP - Registration

Paging Update

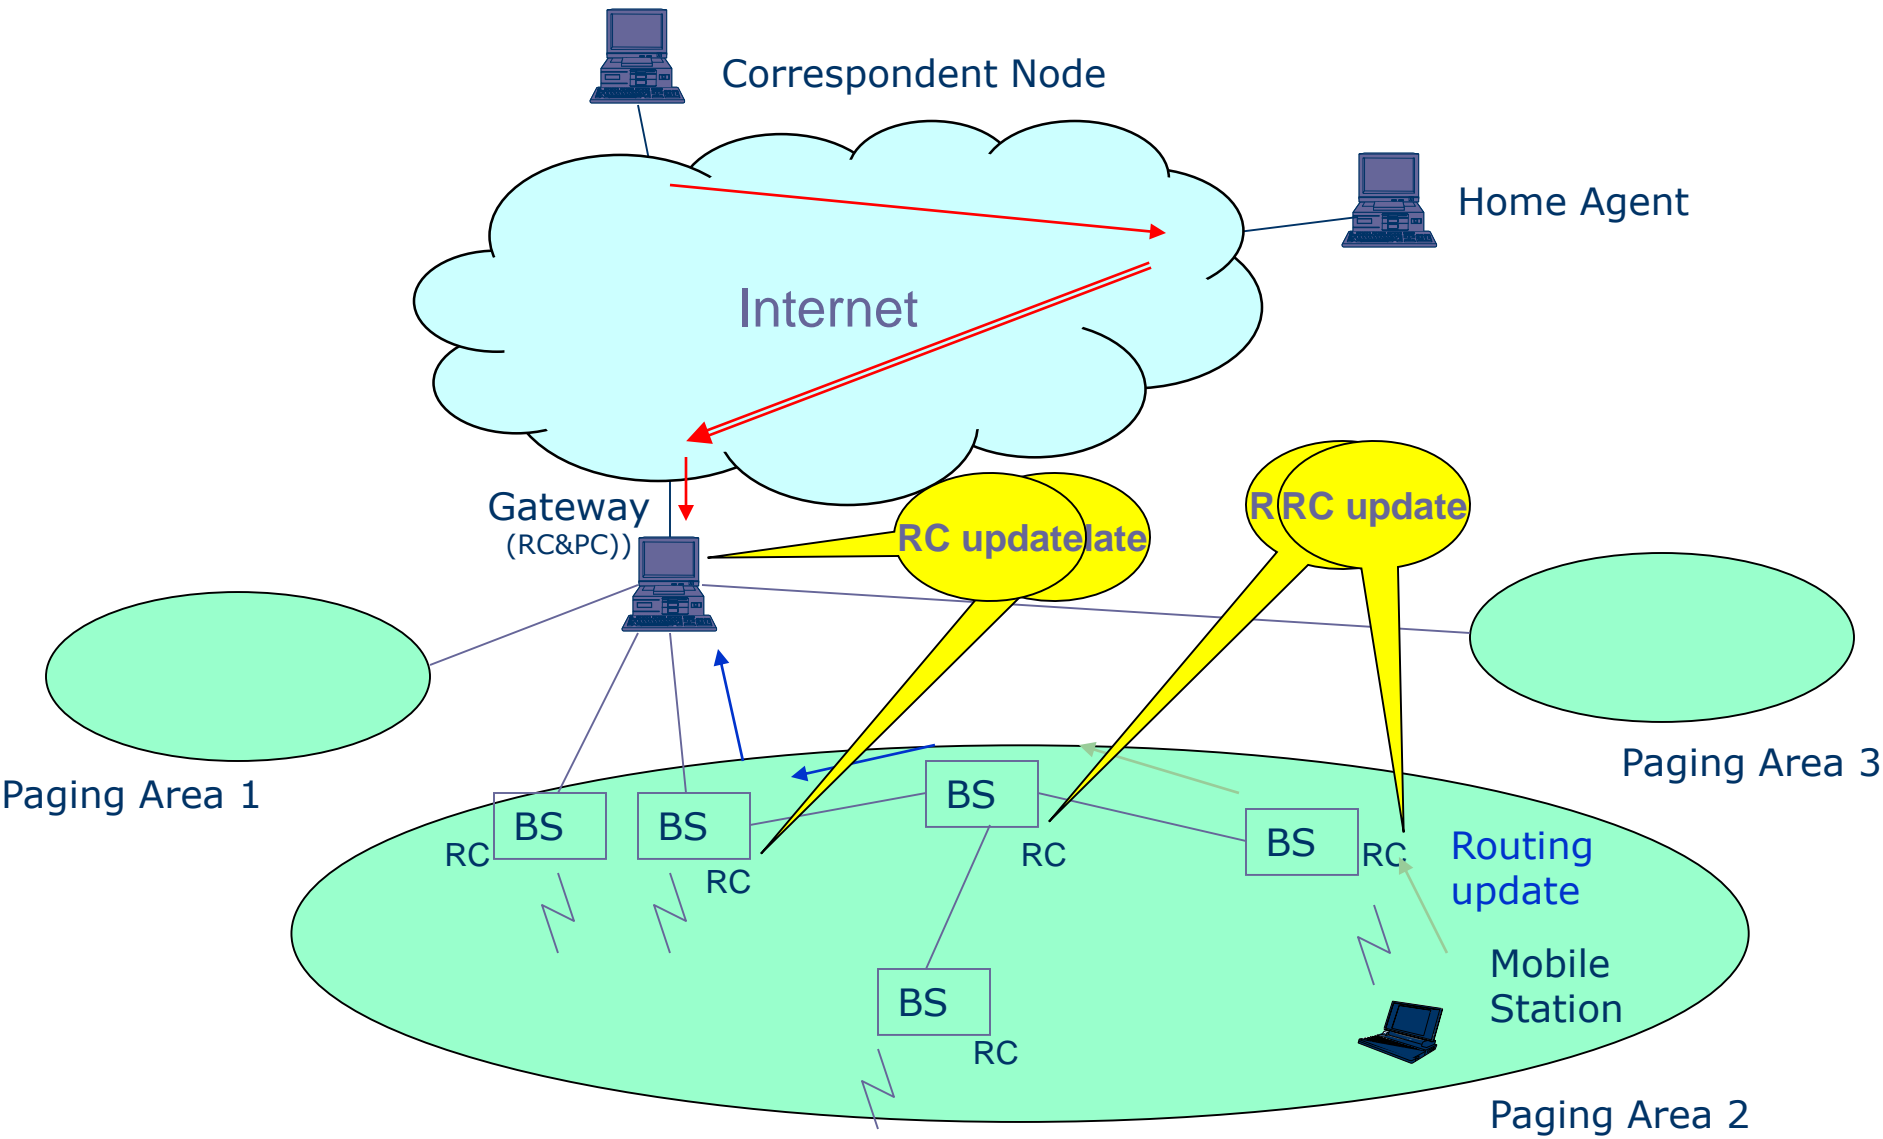

Change of Paging Area

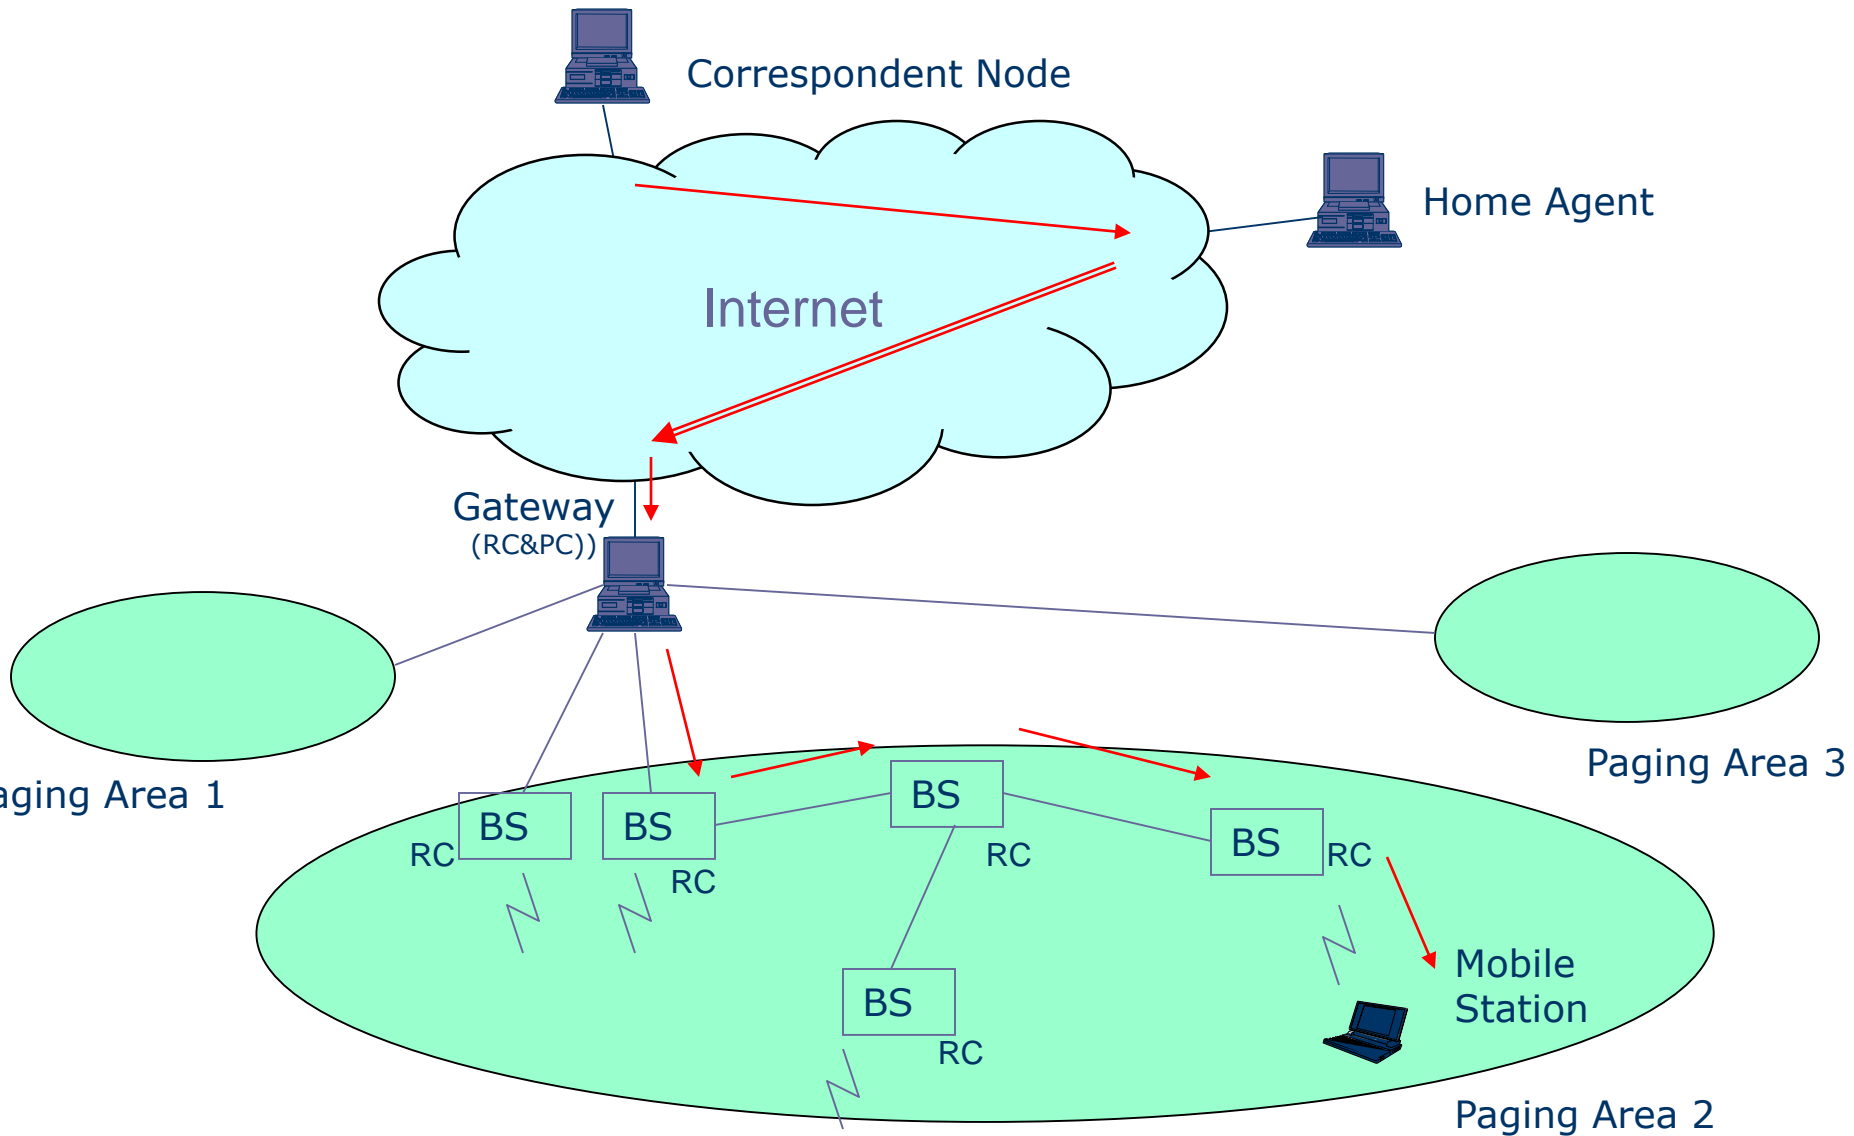

Cellular IP – Paging Request

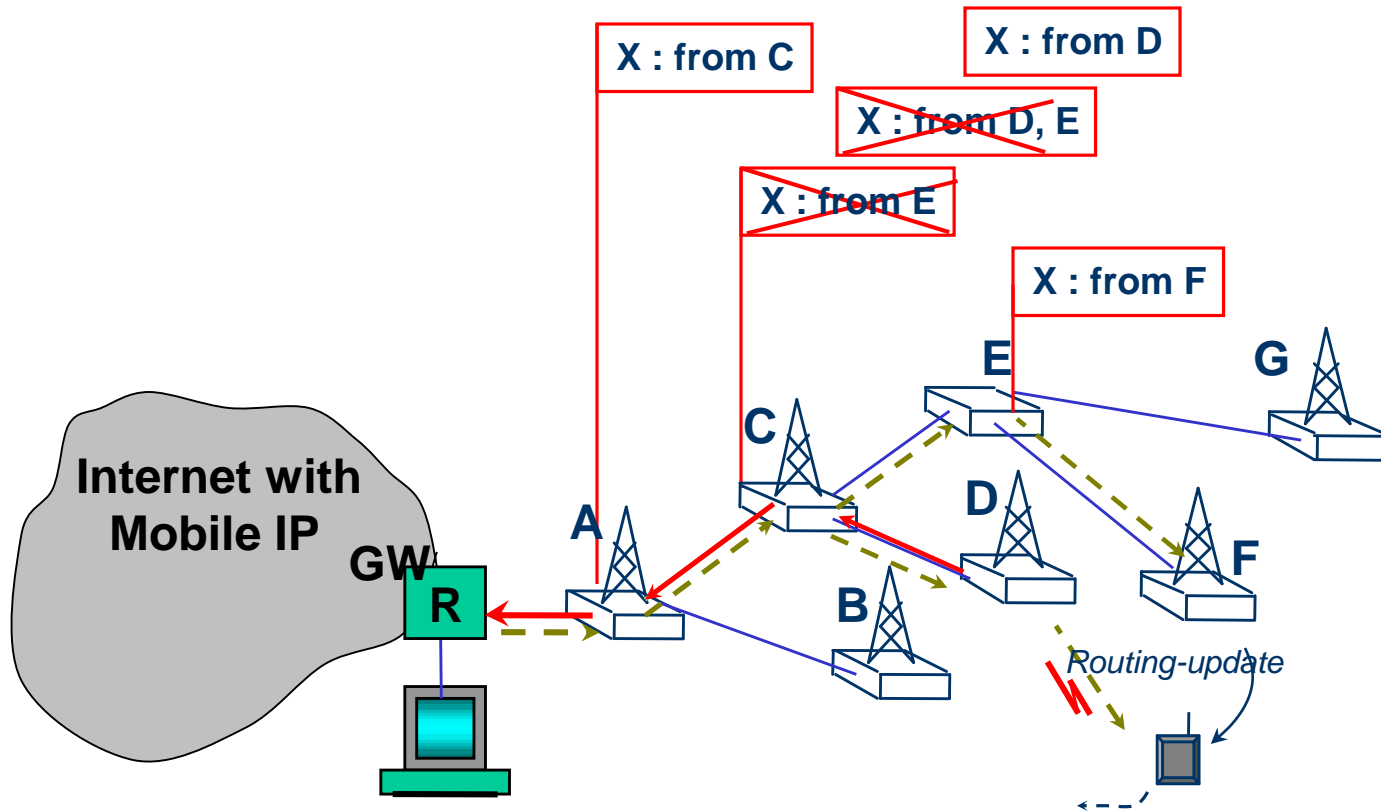

Cellular IP – Paging Response

Cellular IP – Data Delivery

Routing Update (handover)

Wireless and/or Mobile

<u>Wireless</u>	<u>Mobile</u>	<u>Application</u>
NO	NO	Static work stations
NO	YES	Laptop in hotel
YES	NO	Buildings with no cables
YES	YES	Full mobility support

Cellular Network Organization

- Multiple low power transmitters
 - 100w or less
- Area divided into cells
 - Each with own antenna
 - Each with own range of frequencies
 - Served by base station
 - Transmitter, receiver, control unit
 - Adjacent cells on different frequencies to avoid crosstalk

Wireless Standards

Wireless Transmission

- Based on the capability of electrons to move creating electromagnetic waves
 - To all directions
 - With the speed of light
 - Even in space
- Main characteristics of wireless transmission
 - Frequency f = number of oscillations per second (Hertz)
 - Wave length λ = distance between two minimums or two maximums
 - $\lambda * f = c$ (c=speed of light)
- The signals behavior depends on its frequency
 - Low frequency = the signal can go through obstacles, its power density is reduced slowly with distance but the information transferred is small
 - High frequency = The information transferred is larger, but the signal cannot go through obstacles so easily and the power density is reduced quickly with distance (path loss).

Spectrum Allocation

VLF = Very Low Frequency

LF = Low Frequency

MF = Medium Frequency

HF = High Frequency

VHF = Very High Frequency

UHF = Ultra High Frequency

SHF = Super High Frequency

EHF = Extra High Frequency

UV = Ultraviolet Light

Relationship between frequency 'f' and wave length ' λ ' :

$$\lambda = c/f$$

where c is the speed of light $\cong 3 \times 10^8 \text{m/s}$

Signal Propagation Ranges

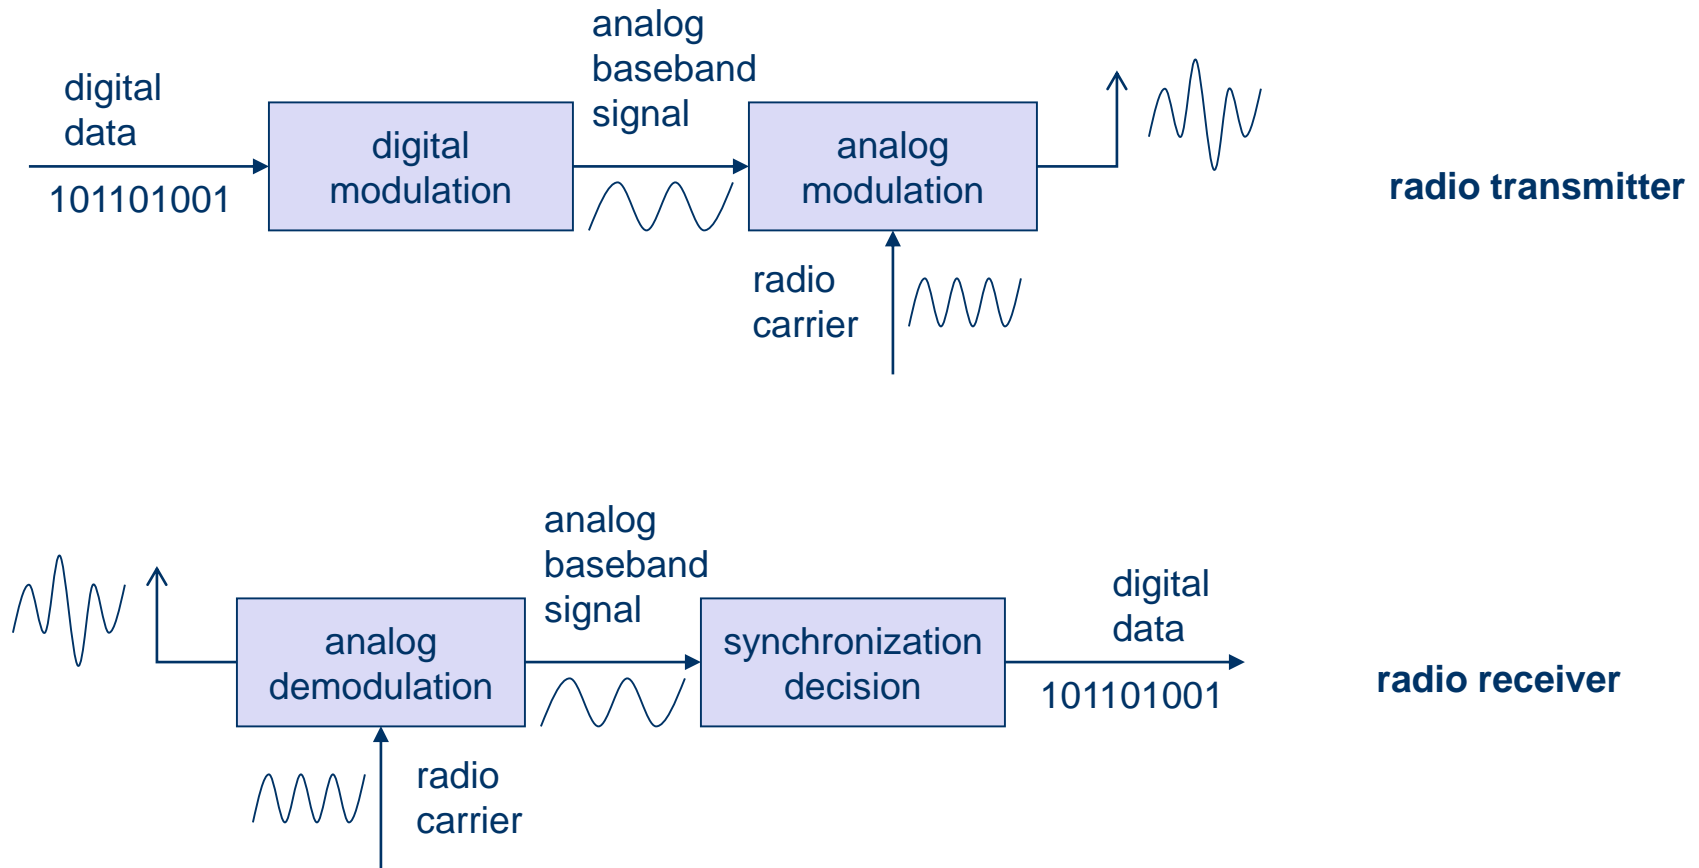

- Transmission range
 - communication possible
 - low error rate
- Detection range
 - detection of the signal possible
 - no communication possible, high error rate
- Interference range
 - signal may not be detected
 - signal adds to the background noise

Baseband transmission

Modulation and Demodulation

Signal Modulation

$$s(t) = A(t) \cos(f(t) t + \phi(t))$$

- (a) unmodulated (digital) signal
- (b) amplitude modulation (AM)
 $s(t) = A(t) \cos(f t + \phi)$
- (c) frequency modulation (FM)
 $s(t) = A \cos(f(t) t + \phi)$
 - FSK (frequency shift keying)
- (d) phase modulation (PM)
 $s(t) = A \cos(f t + \phi(t))$
 - phase shift keying (PSK)
- f : carrier frequency

Sample
 Sample Rate=Samples/sec (Baud Rate)
 During one Sample one **“symbol”** is sent
 Symbol=piece of information=level of voltage

Simpler :
 1 symbol = 1 bit (0/1) = voltage/no voltage

To increase the data rate we cannot reduce
 The sample duration indefinitely

But we can increase the number of possible
 Samples (e.g. amplitude levels)

This is usually combined with PSK

Digital Modulation

- Modulation of digital signals known as Shift Keying
- Amplitude Shift Keying (ASK):
 - very simple
 - low bandwidth requirements
 - very sensitive to interference
- Frequency Shift Keying (FSK):
 - needs larger bandwidth
- Phase Shift Keying (PSK):
 - more complex
 - expensive

Advanced Phase Shift Keying

- BPSK (Binary Phase Shift Keying):
 - bit value 0: wave
 - bit value 1: inverted wave
 - very simple PSK
 - low spectral efficiency
 - robust, used e.g. in satellite systems
- QPSK (Quadrature Phase Shift Keying):
 - 2 bits coded as one symbol
 - more complex
 - better spectral efficiency

Quadrature Amplitude Modulation

- Quadrature Amplitude Modulation (QAM): combines amplitude and phase modulation
- it is possible to code n bits using one symbol
- 2^n discrete levels, $n=2$ identical to QPSK
- bit error rate increases with n , but less errors compared to comparable PSK schemes

Example: 16-QAM (4 bits = 1 symbol)

- BPSK (Binary Phase Shift Keying) = 2 phase shifts, 1 amplitude level, 1 bit/symbol
- QPSK (Quadrature Phase Shift Keying) = 4 phase shifts, 1 amplitude level, 2 bits/symbol
- QAM-16 = 4 phase shifts, 4 amplitude levels, 4 bits/symbol
- QAM-64 = 4 phase shifts, 16 amplitude levels, 6 bits/symbol

QPSK

QAM-16

QAM-64

Number of States (<i>m</i> -ary)	Bits Transmitted Per Symbol
2	1
4	2
8	3
16	4
32	5
64	6
128	7
256	8

Modulation Scheme	Physical Data Rate
BPSK	6 Mbps
BPSK	9 Mbps
QPSK	12 Mbps
QPSK	18 Mbps
16 QAM	24 Mbps
16 QAM	36 Mbps
64 QAM	48 Mbps
64 QAM	54 Mbps

Adaptive (coding and) modulation

Adaptive (Coding and) Modulation (ACM)

- “Link Adaption” or “Dynamic Coding Modulation”
- Functionality
 - Observes change in Signal-to-Noise (SNR) of channel
 - Sends the Code and Modulation Information (CMI) in the header of a packet
 - Changes modulation scheme to optimize throughput

Requirements for ACM

1. Current channel conditions must be known with reasonable accuracy
 - Open Loop Information
 - Received Signal Information
 - Closed Loop (Feedback) Information
 - Receiver sends SNR Measurements to Transmitter
 - Requires a feedback channel

Requirements for ACM

2. Channel conditions must remain constant or change slowly relative to the adaption rate
 - Two Categories of Channel Fading Impairments
 - Fast Channel Fading (ex: Multi-Path)
 - Slow Channel Fading (ex: Shadow Fading)
 - Goal is to adjust SNR update rates so that:
 - SNR updates slow enough to average fast fading effects
 - SNR updates fast enough to track slow fading effects

ACM schemes in LTE (4G)

ID (c_l)	level	$r(c_l)$ [bits/symbol]	SNR boundary [dB] ¹
0	Silent	0	0
1	QPSK(1/2)	1	6
2	QPSK(3/4)	1.5	8.5
3	16QAM(1/2)	2	11.5
4	16QAM(3/4)	3	15
5	64QAM(2/3)	4	18.5
6	64QAM(3/4)	4.5	21

Trick question: What is the difference between LTE and 4G

Multiple access protocols

Channel Types

- Broadcast channels
 - ◆ (at least) one transmits and (possibly) many receive (simultaneously)
- Multi-access channels
 - ◆ Many transmitters use one (single) channel to communicate with (at least) one receiver (not necessarily simultaneously)
 - ◆ Possibly communicate between themselves
- Example: Mobile phone and base station
 - ◆ Mobile phone  base station : multiple access channel (many transmitters send to a single receiver)
 - ◆ Base station  mobile phone: the sender broadcasts to many receivers

Multiple Access Control Channels

- N independent stations
 - ◆ Assumption of limited or unlimited number
 - ◆ Poisson arrivals
 - ◆ Fixed packet length
- Single Channel
- Collisions are possible
 - Carrier sensing
 - Collision detection
- Time assumptions
 - ◆ Segmented non-continuous time / Synchronous mode
 - ◆ Non-segmented continuous time / Asynchronous mode

Multiplexing Techniques

- Multiplexing techniques are used to allow many users to **share** a common transmission resource. In our case the users are mobile and the transmission resource is the radio spectrum. Sharing a common resource requires an access mechanism that will control the multiplexing mechanism.
- As in wireline systems, it is desirable to allow the **simultaneous** transmission of information between two users engaged in a connection. This is called **duplexing**.
- Two types of duplexing exist:
 - Frequency division duplexing (FDD), whereby two frequency channels are assigned to a connection, one channel for each direction of transmission.
 - Time division duplexing (TDD), whereby two time slots (closely placed in time for duplex effect) are assigned to a connection, one slot for each direction of transmission.

Multiplexing

- Multiplexing allows parallel transmission from different sources, handling interference.
- Three basic kinds
 - **TDM/TDMA** (Time Division Multiple Access)
 - **FDM/FDMA** (Frequency Division Multiple Access)
 - **CDMA** (Code Division Multiple Access)
 - Combinations of the above

Frequency Division Multiplexing (FDM)

- Separation of the whole spectrum into smaller frequency bands
- A channel gets a certain band of the spectrum for the whole time

Advantages:

- no dynamic coordination necessary
- works also for analog signals
- cheaper

Disadvantages:

- waste of bandwidth if the traffic is distributed unevenly
- inflexible

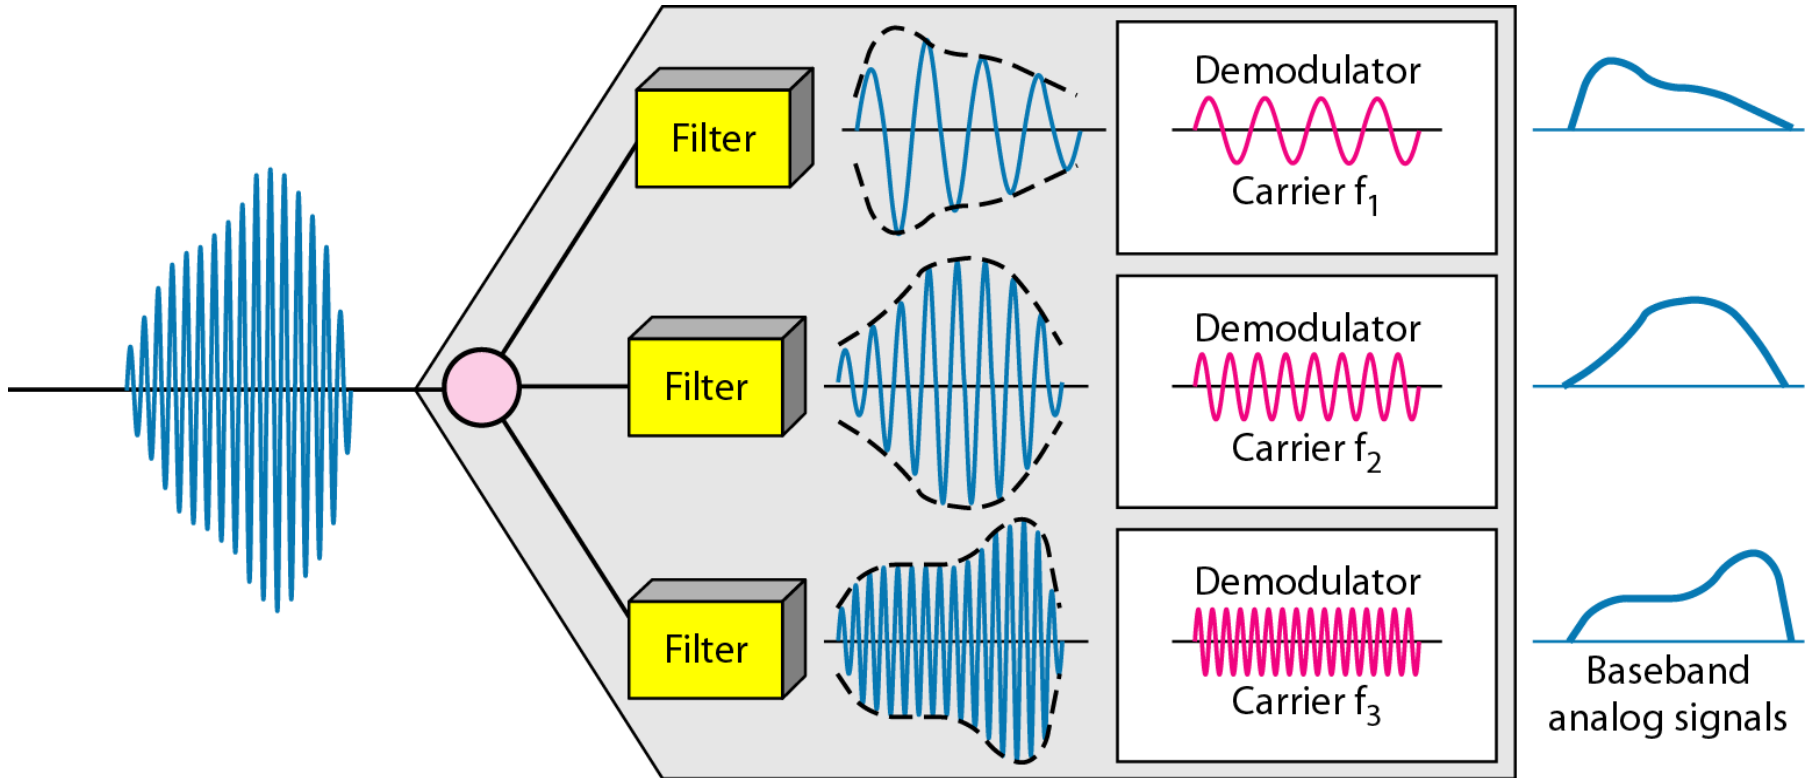

Frequency Division Multiplexing (FDM)

Frequency Division Multiplexing (FDM)

Frequency Division Multiplexing (FDM)

Time Division Multiplexing (TDM)

- A channel gets the whole spectrum for a certain amount of time
- Advantages:
 - only one carrier in the medium at any time
 - throughput high - supports bursts
 - flexible – multiple slots
- Disadvantages:
 - Precise synchronization necessary
 - high bit rates at each Tx/Rx

Time Division Multiplexing (TDM)

Code Division Multiple Access (CDMA)

Code Division Multiple Access (CDMA)

Near-far problem in CDMA

- A CDMA receiver cannot successfully de-spread the desired signal in a high multiple-access-interference environment
- Unless a transmitter close to the receiver transmits at power lower than a transmitter farther away, the far transmitter cannot be heard
- Power control must be used to mitigate the near-far problem
- Mobiles transmit at such power levels to ensure that received power levels are equal at base station

- Power control and channel problems!

Hybrid TDM/FDM

- Combination of both methods
- A channel gets a certain frequency band for a certain amount of time (slot).
- Advantages:
 - better protection against interference and tapping
- Disadvantages:
 - Better synchronization required
 - More expensive
