Some Review Questions

Winter 2025

1. Derive in detail, step-by-step and with rigor the binomial distribution (prob for k successes in n trials). You are supposed to justify all steps precisely.
2. Understand why the Poisson RV is a good model for an aggregate event process over fixed period and under what assumptions.
3. Sketch a proof for the memoryless property of the exponential distribution. Understand the implications.
4. Understand the various definitions / interpretations of a stochastic process and their relation to random variables.
5. Through aspects of the presented construction, justify the key properties of the Wiener process and its applicability.
6. Derivative of the Wiener process and the integral of a white process and their autocorrelation
7. Ergodicity: definition (qualitative and quantitative) and why it is important.
8. Formal definition of a Poisson process and the 3 basic properties.
9. Poisson process behavior over very small time intervals in terms of number of events producing.
10. Alternative definitions of a Poisson process and ways to check if data points conform to a Poisson process.
11. How could one claim a similarity between a Wiener and a Poisson process, based on a similar metric or intuitively?
12. Understand the uniformity of the distribution of the time of arrivals of a number of arrivals that are known to have occurred over an interval.
13. Conditions under which a Poisson could be approximated by a Normal distribution and why.
14. Burstiness of the Poisson process.
15. Memorylessness of the Poisson interarrival times.
16. Forward recurrence times of a Poisson process and its implication.
17. Merging and splitting Poisson processes: resulting processes.
18. Definition of a compound Poisson process
19. Key property and definition of a MC.

20. Chapman Kolmogorov equations
21. Examples for checking the Markov property and setting up the stochastic matrix.
22. Conditional independence of a function of a MC from past visits given the current
23. Visits to a state: familiarize yourselves with the quantities $N_j(\omega)$, $F_k(i,j)$ and its recursive computation, and the potential $R(i,j)$ and its relation to $F_k(i,j)$.
24. Classification of states - definitions of states
25. What are the limiting probabilities for visiting a transient or a recurrent –non-null state.
26. What is an irreducible set of states or an irreducible MC?
27. How to Identify closed sets of states in a MC – examples
28. Understand how to organize recurrent states of a MC in irreducible sets
29. Characterization of states of an irreducible MC. Can there be a mix of recurrent null and recurrent non-null?
30. What type of states exist in an irreducible MC with a finite number of states?
31. Learn how to determine the type of states in a MC with a finite number of states –example
32. What type of states exist in an irreducible MC with an infinite number of states?
33. What is the condition (involving the transition matrix) in order for all states to be recurrent non-null, in an irreducible MC with an infinite number of states?
34. What is the condition (involving the transition matrix) in order for all states to be transient, in an irreducible MC with an infinite number of states?
35. Understand how to derive the matrices for S and F shown on slides 56 and 61.
36. What is the invariant distribution of an irreducible MC with recurrent non-null states and how is it related to the limiting probabilities of that MC?
37. Understand how we can use the limiting probabilities of an irreducible MC with recurrent non-null states to calculate average value of a bounded function on the state space.
38. Consider a discrete-time buffer occupancy system and investigate if the occupancy process is a MC, under various assumptions on the arrival and service processes.
39. Embedded MCs: Understand how by embedding a process on a specific sequence of times can yield a MC, when this is not generally the case for a random time.
40. M/G/1 and G/M/1: What is the environment they can model? How is the Markovian property ensured or proven? How is the stochastic matrix derived?

What is the basic parameter whose value shapes the type of states of the resulting MC?

41.Examples of MCs – See cases of how to set up a MC and its stochastic matrix from a system description and answer some performance question. For instance, the study of the slotted Aloha protocol.
