

Introduction to Bioinformatics

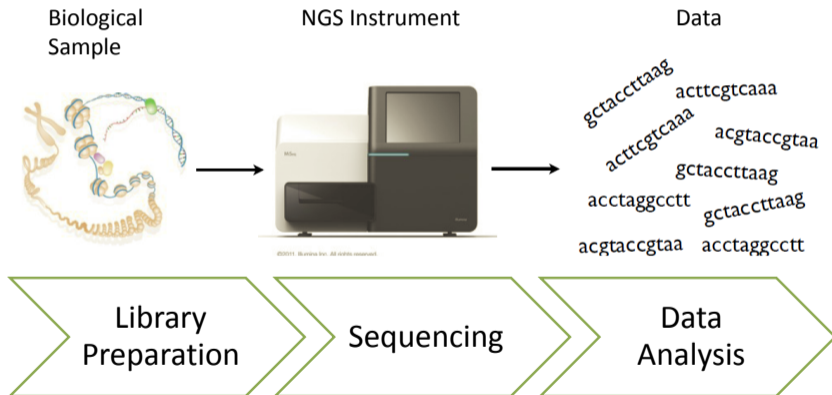

Alexandros C. Dimopoulos
alexdem@di.uoa.gr

Master of Science
“Data Science and Information Technologies”
Department of Informatics and Telecommunications
National and Kapodistrian University of Athens

2023-24

NGS Overview

NGS “Hardware” I

Roche GS-FLX

Life Technologies SOLiD

Life Technologies Ion Proton

Illumina HiSeq

Life Technologies Ion Torrent

Illumina MiSeq

NGS “Hardware” II

Pacbio Sequel

Oxford Nanopore

NGS Technologies I

- fluorescence-based (Illumina)

- hydrogen ion /pH-mediated based (Life)

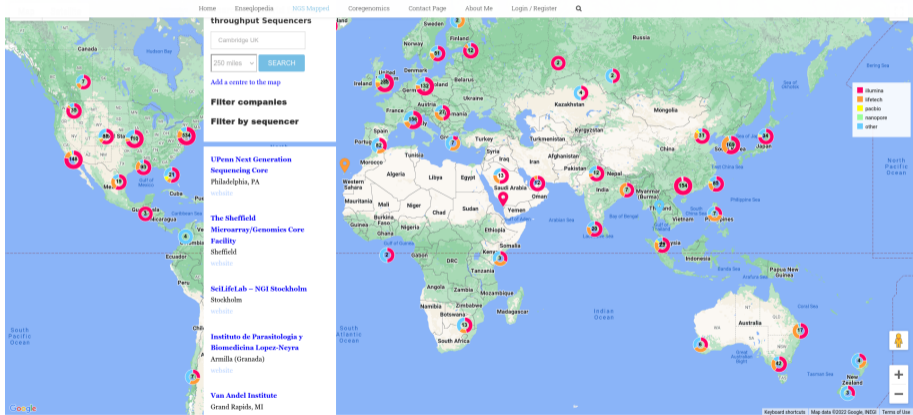

NGS Technologies II

	Run Time	Read Length	Quality	Total nucleotides sequenced	Cost /MB
454 Pyrosequencing	24h	700 bp	Q20-Q30	1 GB	\$10
Illumina Miseq	27h	2x300bp	> Q30	15 GB	\$0.15
Illumina Hiseq 2500	1 - 10days	2x250bp	>Q30	3000 GB	\$0.05
Ion torrent	2h	400bp	>Q20	50MB-1GB	\$1
Pacific Biosciences	30m - 4h	10kb - >40kb	>Q50 consensus >Q10 single	500 - 1000MB /SMRT cell	\$0.13 - \$0.60

Growing demand

<http://enseqlopedia.com/ngs-mapped/>

Sequencing options

Single-end

- Cheaper
- Suitable for more general purpose analyzes, e.g. DE

Single-end sequencing

Paired-end

- More information regarding the length and the position of a read
- Useful for spliced junctions, indels etc.

Paired-end sequencing

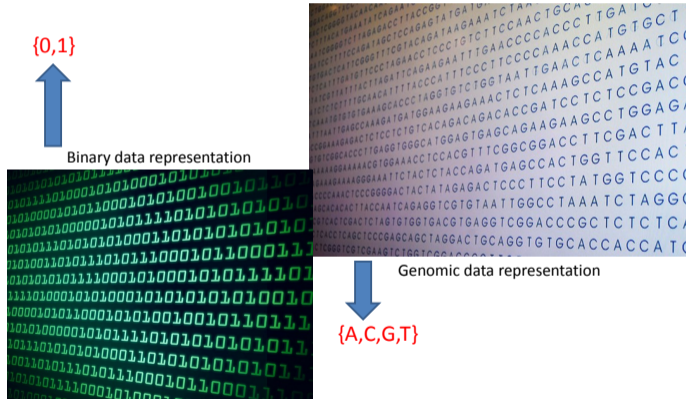

Zhernakova, Daria V., et al. "DeepSAGE reveals genetic variants associated with alternative polyadenylation and expression of coding and non-coding transcripts."

(2013): e1003594.

Bioinformatics is a necessity I

Bioinformatics is a necessity II

FASTQ file format

FASTQ

Text-based format for storing biological sequences

- Raw unaligned reads (nucleotides)
- Corresponding quality scores

```
@HWI-ST661:319:D28MYACXX:6:1101:1170:2180 1:N:0:GTGGCC  
NAGTGGTTTATGCCTGTAATCCCAGCATTTTGGGAGACGAAGTTGAGAN  
+  
#1:ADDFFHGHHHIJGHIIJJJIIIEHIJJJIHEHIGHIJHHJGHC#
```

Phred quality score

$$Q = -10 \log_{10} P$$

P: base-calling error probability

Q: Phred quality score

Phred Quality Score	Probability of incorrect base call	Base call accuracy
10	1 in 10	90%
20	1 in 100	99%
30	1 in 1000	99.9%
40	1 in 10,000	99.99%
50	1 in 100,000	99.999%
60	1 in 1,000,000	99.9999%

FASTA file format II

- During the alignment process the reads of a fastq file are mapped on a reference genome stored in fasta format
- There are various available genomes, e.g. :
 - Human: hg16 (2003), hg17 (2004), hg18 (2006), hg19 (NCBI)/GRCh37 (Ensembl) (2009), hg38/GRCh38 (2013)
 - Mouse: mm7 (2005), mm8 (2006), mm9 (2007), mm10 (2011)
 - D. melanogaster: dm1 (2003), dm2 (2004), dm3 (2006), dm6 (2014)
 - ...

SAM/BAM format I

SAM - Sequence Alignment Map

SAM format stores aligned reads and is independent of the sequencing technology used

- SAM: textbased
- BAM: binary

SAM/BAM format II

```
@HD VN:1.6 SO:coordinate
@SQ SN:ref LN:45
r001 99 ref 7 30 8M2I4M1D3M = 37 39 TTAGATAAAGGATACTG *
r002 0 ref 9 30 3S6M1P1I4M * 0 0 AAAAGATAAGGATA *
r003 0 ref 9 30 5S6M * 0 0 GCCTAAGCTAA * SA:Z:ref,29,-,6H5M,17,0;
r004 0 ref 16 30 6M14N5M * 0 0 ATAGCTTCAGC *
r003 2064 ref 29 17 6H5M * 0 0 TAGGC * SA:Z:ref,9,+,5S6M,30,1;
r001 147 ref 37 30 9M = 7 -39 CAGCGGCAT * NM:i:1
```

SAM/BAM format III

BED format

BED - Browser Extensible Data

Per line

- 3 mandatory fields
 - chrom - The chromosome name, e.g. chr3, chrY, chr2_random
 - chromStart - The start position of a feature in the chromosome - **0-based numbering**.
 - chromEnd - The end position of a feature in the chromosome. The end position **in not** included in the feature. E.g. the first 100 bases of a chromosome are defined as chromStart=0, chromEnd=100, and are the bases 0-99
- 9 optional fields
 - name, score, strand, thickStart, thickEnd, itemRgb, blockCount, blockSizes, blockStarts

VCF format I

VCF files - Variant Call Format

- For encoding structural variations
- Widely used by the 1000 Genomes Project
- Only the variants are stored along with the reference genome

VCF format II

```

1 ##fileformat=VCFv4.1

```

- AF: allele frequency for each ALT allele
- DP: combined depth across samples
- DB: dbSNP membership
- H2: membership in hapmap2
- NS: Number of samples with data

index files

Index creation, for faster data access since it enables non sequential search

- fasta → fai
- bam → bai
- vcf → idx
- vcf.gz → tbi

samtools I

samtools

Samtools is a suite of programs for interacting with high-throughput sequencing data. It consists of three separate repositories:

Samtools Reading/writing/editing/indexing/viewing SAM/BAM/CRAM format

BCFtools Reading/writing BCF2/VCF/gVCF files and calling/filtering/summarising SNP and short indel sequence variants

HTSlib A C library for reading/writing high-throughput sequencing data

<http://www.htslib.org/>

samtools II

```
$ samtools
```

```
Program: samtools (Tools for alignments in the SAM format)
```

```
Version: 1.3 (using htslib 1.3)
```

```
Usage:  samtools <command> [options]
```

```
Commands:
```

```
-- Indexing
```

```
dict          create a sequence dictionary file
```

```
faidx         index/extract FASTA
```

```
index         index alignment
```

samtools III

-- Editing

calmd	recalculate MD/NM tags and '=' bases
fixmate	fix mate information
reheader	replace BAM header
rmdup	remove PCR duplicates
targetcut	cut fosmid regions (for fosmid pool only)
addreplacerg	adds or replaces RG tags

-- File operations

collate	shuffle and group alignments by name
cat	concatenate BAMs
merge	merge sorted alignments
mpileup	multi-way pileup

samtools IV

sort	sort alignment file
split	splits a file by read group
quickcheck	quickly check if SAM/BAM/CRAM file appears intact
fastq	converts a BAM to a FASTQ
fasta	converts a BAM to a FASTA
-- Statistics	
bedcov	read depth per BED region
depth	compute the depth
flagstat	simple stats
idxstats	BAM index stats
phase	phase heterozygotes
stats	generate stats (former bamcheck)

samtools V

```
-- Viewing
flags          explain BAM flags
tview          text alignment viewer
view           SAM<->BAM<->CRAM conversion
depad         convert padded BAM to unpadded BAM
```

samtools VI

- **sort**: after the alignment process, the final sam file contains the reads in a random order. For random access and also for the conversion to bam, the sam file needs to be sorted

```
samtools sort sample.bam sample.sorted -@8
```

- **index**: for the faster data access of the bam file

```
samtools index sample.sorted.bam
```

- **view**: for sam to bam conversion and vice versa. For filtering a sam/bam file based on conditions

```
samtools view sample.bam
```

```
samtools view -f 0x2 sample.sorted.bam
```

```
samtools view -F 0x2 sample.sorted.bam
```

Bedtools I

bedtools: a powerful toolset for genome arithmetic

Collectively, the bedtools utilities are a swiss-army knife of tools for a wide-range of genomics analysis tasks. The most widely-used tools enable genome arithmetic: that is, set theory on the genome. For example, bedtools allows one to intersect, merge, count, complement, and shuffle genomic intervals from multiple files in widely-used genomic file formats such as BAM, BED, GFF/GTF, VCF. While each individual tool is designed to do a relatively simple task (e.g., intersect two interval files), quite sophisticated analyses can be conducted by combining multiple bedtools operations on the UNIX command line

<http://bedtools.readthedocs.io/en/latest/>

Bedtools II

```
$ bedtools
```

```
bedtools: flexible tools for genome arithmetic and DNA sequence analysis.
```

```
usage: bedtools <subcommand> [options]
```

The bedtools sub-commands include:

```
[ Genome arithmetic ]
```

```
intersect      Find overlapping intervals in various ways.
```

```
window        Find overlapping intervals within a window around  
an interval.
```

```
...
```

Bedtools III

bedtools intersect

By far, the most common question asked of two sets of genomic features is whether or not any of the features in the two sets “overlap” with one another. This is known as feature intersection. `bedtools intersect` allows one to screen for overlaps between two sets of genomic features. Moreover, it allows one to have fine control as to how the intersections are reported. `bedtools intersect` works with both BED/GFF/VCF and BAM files as input.

Bedtools IV

```
$ bedtools intersect
```

```
Tool:      bedtools intersect (aka intersectBed)
```

```
Version:  v2.21.0
```

```
Summary:  Report overlaps between two feature files.
```

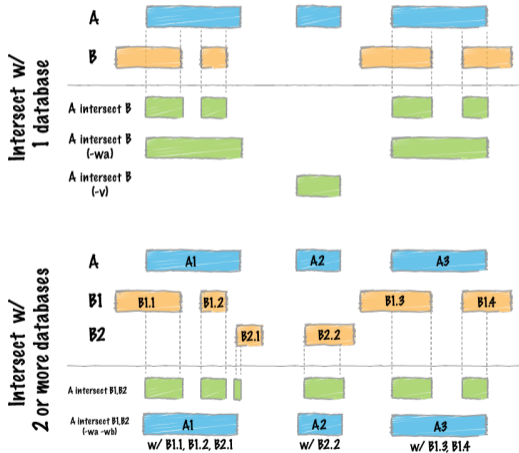

```
Usage:    bedtools intersect [OPTIONS] -a <bed/gff/vcf> -b <bed/gff/vcf>
```

```
Note: -b may be followed with multiple databases and/or  
wildcard (*) character(s).
```

```
...
```

Bedtools V

Bedtools VI

```
$ cat A.bed  
chr1 10 20  
chr1 30 40
```

```
$ cat B.bed  
chr1 15 20
```

```
$ bedtools intersect -a A.bed -b B.bed  
chr1 15 20
```

Bedtools VII

bedtools merge

bedtools merge combines overlapping or “book-ended” features in an interval file into a single feature which spans all of the combined features.

Bedtools VIII

```
$ bedtools merge
```

```
Tool:      bedtools merge (aka mergeBed)
```

```
Version:  v2.21.0
```

```
Summary:  Merges overlapping BED/GFF/VCF entries into a single interval.
```

```
Usage:    bedtools merge [OPTIONS] -i <bed/gff/vcf>
```

```
...
```

Bedtools IX

Bedtools X

```
$ cat A.bed
```

```
chr1 100 200
```

```
chr1 180 250
```

```
chr1 250 500
```

```
chr1 501 1000
```

```
$ bedtools merge -i A.bed
```

```
chr1 100 500
```

```
chr1 501 1000
```

Bedtools XI

bedtools genomecov

bedtools genomecov computes histograms (default), per-base reports (-d) and BEDGRAPH (-bg) summaries of feature coverage (e.g., aligned sequences) for a given genome.

Bedtools XII

```
$ bedtools genomecov
```

```
Tool:    bedtools genomecov (aka genomeCoverageBed)
```

```
Version: v2.21.0
```

```
Summary: Compute the coverage of a feature file among a genome.
```

```
Usage: bedtools genomecov [OPTIONS] -i <bed/gff/vcf> -g <genome>
```

```
...
```

Bedtools XIV

```
$ cat A.bed  
chr1 10 20  
chr1 20 30  
chr2 0 500
```

```
$ cat my.genome  
chr1 1000  
chr2 500
```

```
$ bedtools genomecov -i A.bed -g my.genome  
chr1 0 980 1000 0.98  
chr1 1 20 1000 0.02  
chr2 1 500 500 1
```

Bedtools XV

```
genome 0 980 1500 0.653333  
genome 1 520 1500 0.346667
```

VCFTools I

Welcome to VCFTools

VCFTools is a program package designed for working with VCF files, such as those generated by the 1000 Genomes Project. The aim of VCFTools is to provide easily accessible methods for working with complex genetic variation data in the form of VCF files.

`https://vcftools.github.io/index.html`

VCFTools II

```
$ vcftools
```

```
VCFTools (0.1.15)
```

```
© Adam Auton and Anthony Marcketta 2009
```

```
Process Variant Call Format files
```

```
For a list of options, please go to:
```

```
  https://vcftools.github.io/man_latest.html
```

```
Alternatively, a man page is available, type:
```

```
  man vcftools
```

```
Questions, comments, and suggestions should be emailed to:
```

```
  vcftools-help@lists.sourceforge.net
```

VCFTools III

vcf-isec

Creates intersections and complements of two or more VCF files. Given multiple VCF files, it can output the list of positions which are shared by at least N files, at most N files, exactly N files, etc. The first example below outputs positions shared by at least two files and the second outputs positions present in the files A but absent from files B and C.

```
vcf-isec -n +2 A.vcf.gz B.vcf.gz | bgzip -c > out.vcf.gz
```

```
vcf-isec -c A.vcf.gz B.vcf.gz C.vcf.gz | bgzip -c > out.vcf.gz
```

VCFTools IV

vcf-merge

Merges two or more VCF files into one so that, for example, if two source files had one column each, on output will be printed a file with two columns. See also `vcf-concat` for concatenating VCFs split by chromosome.

```
$ vcf-merge A.vcf.gz B.vcf.gz C.vcf.gz | bgzip -c > out.vcf.gz
```

VCFTools V

vcf-concat

Concatenates VCF files (for example split by chromosome). Note that the input and output VCFs will have the same number of columns, the script does not merge VCFs by position (see also vcf-merge).

```
$ vcf-concat A.vcf.gz B.vcf.gz C.vcf.gz | gzip -c > out.vcf.gz
```

VCFTools VI

vcf-compare

Compares positions in two or more VCF files and outputs the numbers of positions contained in one but not the other files; two but not the other files, etc, which comes handy when generating Venn diagrams. The script also computes numbers such as nonreference discordance rates (including multiallelic sites), compares actual sequence (useful when comparing indels), etc.

```
$ vcf-compare A.vcf.gz B.vcf.gz C.vcf.gz
```

bcftools

bcftools

BCFtools is a set of utilities that manipulate variant calls in the Variant Call Format (VCF) and its binary counterpart BCF. All commands work transparently with both VCFs and BCFs, both uncompressed and BGZF-compressed.

Most commands accept VCF, bgzipped VCF and BCF with filetype detected automatically even when streaming from a pipe. Indexed VCF and BCF will work in all situations.

Un-indexed VCF and BCF and streams will work in most, but not all situations. In general, whenever multiple VCFs are read simultaneously, they must be indexed and therefore also compressed.

BCFtools is designed to work on a stream. It regards an input file “-” as the standard input (stdin) and outputs to the standard output (stdout). Several commands can thus be combined with Unix pipes.
