

Syllabus and grading

#	Date	Short title	Lecturer	Subject
1	7/10/25	introduction	MR	Overview of Bioinformatics, sequence alignment
2	14/10/25	Linux/shell/ssh	AD	Introduction to Linux and the command line, bash scripting and ssh
3	21/10/25	QC+RNASeq	MR	Next generation sequencing: introduction, quality control and gene expression analysis for RNAseq
4	4/11/25	R (1)	AD	Introduction to the R programming language and Rstudio usage
5	11/11/25	R (2)	AD	Advances R subjects, introduction to Bioconductor
6	18/11/25	bedtools/vcftools/samtools fl	AD	Command line tool usage: bedtools, vcftools, samtools etc.
7	25/11/25	Denovo	MR	NGS for denovo genome and transcriptome assembly
8	2/12/25	Exome/SNP calling	AD	Pipelines for SNP calling, especially for exome sequencing using the GATK pipeline
9	9/12/25	ChipSeq/chirp	MR	NGS analysis for molecular interactions (ChipSeq, (Par-)Clip, structural sequencing, chromosome conformation capture (3C))
10	16/12/25	metabolomics 	MR	Pipelines for SNP calling, especially for exome sequencing using the GATK pipeline
11	13/1/26	presentations	MR+AD	Paper presentations by students
12	20/1/26	presentations	MR+AD	Genome-scale models of metabolism and macromolecular expression, Biological applications of Transformers
13	27/1/26	final projects support	MR+AD	Support for the final project

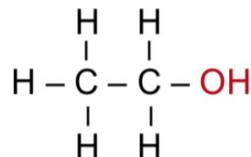

Grade	100%
Presentation	30%
Exercises	20%
Final Project	50%

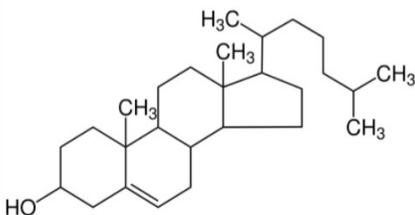

Amino acids

Sugars

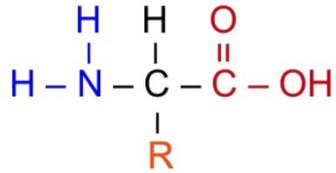

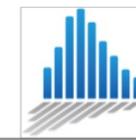

Alcohols

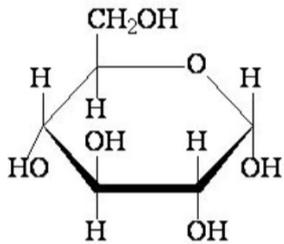

Lipids

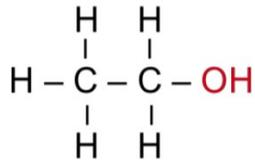

- small molecule
 - $MW < 1500 \text{ Da}$
eg. sugars, amino acids, phenolics, lipids, small peptides
- physically and chemically complex
 - *vast range of chemical structures & properties; polarity, solubility, volatility, stability*
- wide concentration range
 - *mM to sub pM*
 - *dynamic with constant synthesis, absorption, degradation, modification*
 - *metabolite levels change with half life of mins or secs*

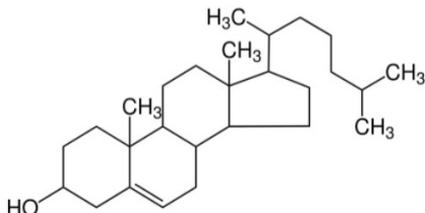

Amino acids

Sugars

Alcohols

Lipids

Primary Metabolites

directly involved in normal growth, development, and reproduction.

- *Glucose, lactic acid, vitamin B2*

Secondary Metabolites

not required for primary metabolic processes but have an important ecological role or other function.

- *defense against predators and other interspecies defenses (plants), toxins, antibiotics, flavorings*

metabolite

/mi'tabəlaɪt/

noun **BIOCHEMISTRY**

noun: **metabolite**; plural *noun*: **metabolites**

a substance formed in or necessary for metabolism.

Use over time for: metabolite

metabolome

/mi'tabələʊm/

noun **BIOCHEMISTRY**

noun: **metabolome**; plural *noun*: **metabolomes**

the total number of metabolites present within an organism, cell, or tissue.

Use over time for: metabolome

metabolomics

/mi'tabələmɪks/

noun **BIOCHEMISTRY**

noun: **metabolomics**

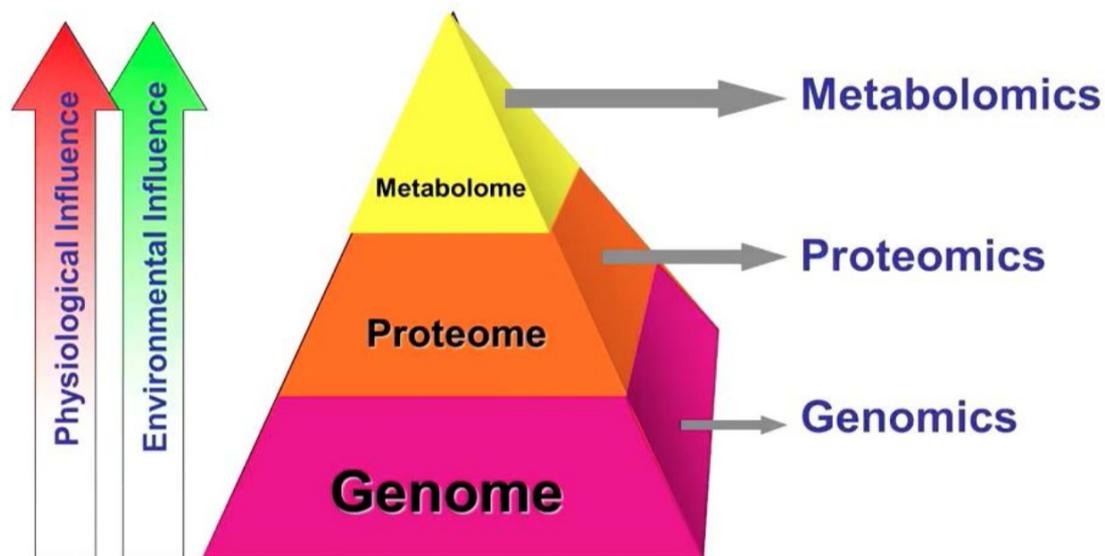

the scientific study of the set of metabolites present within an organism, cell, or tissue.

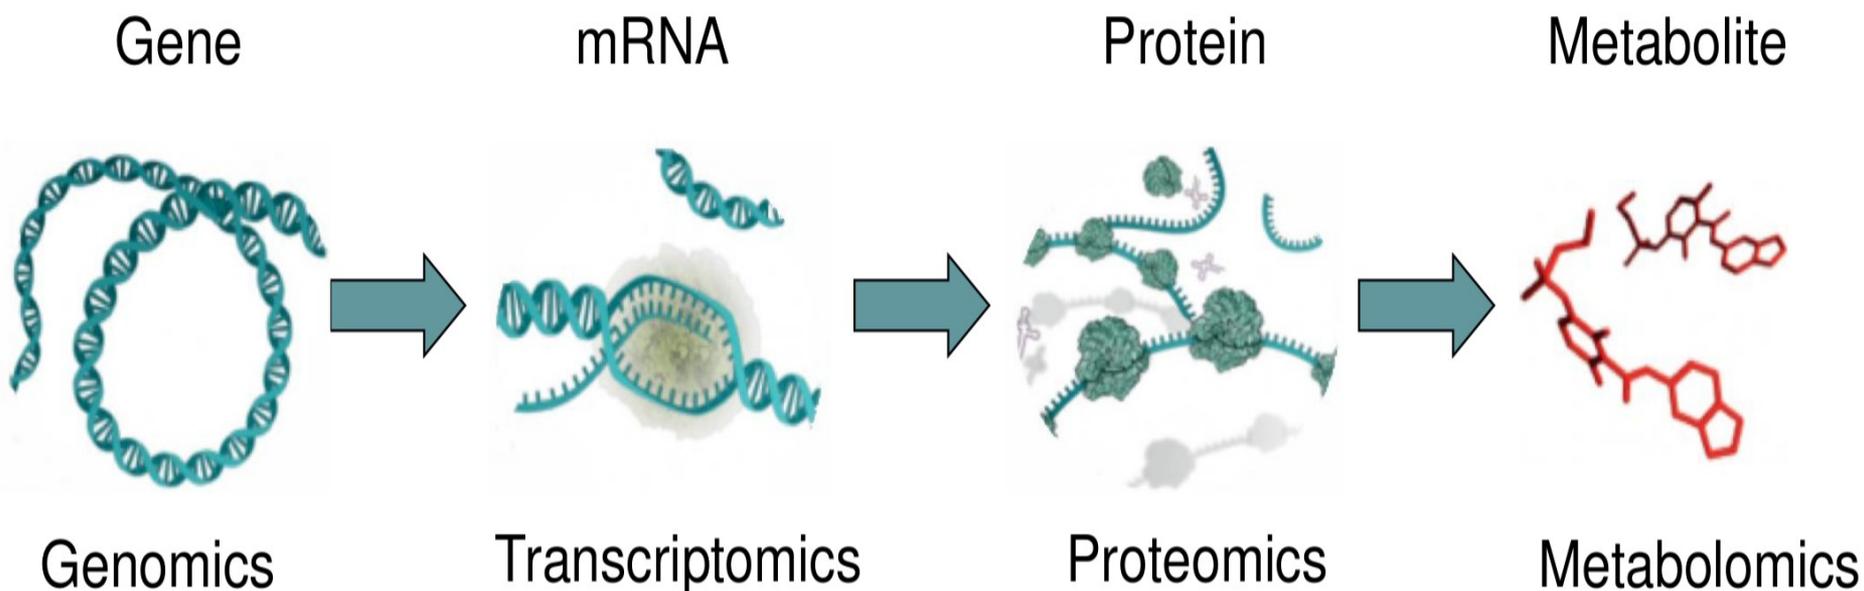

Use over time for: metabolomics

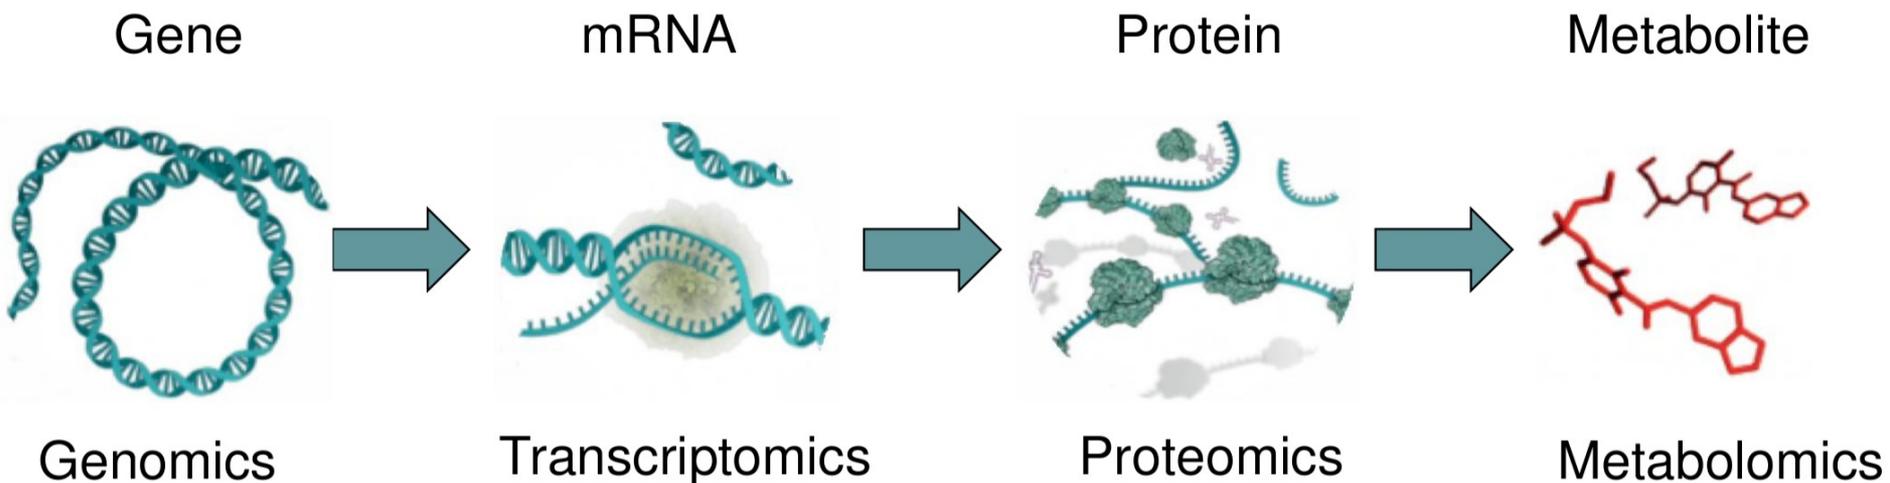

The Pyramid of Life

Metabolomics is complementary to genomic and proteomic studies

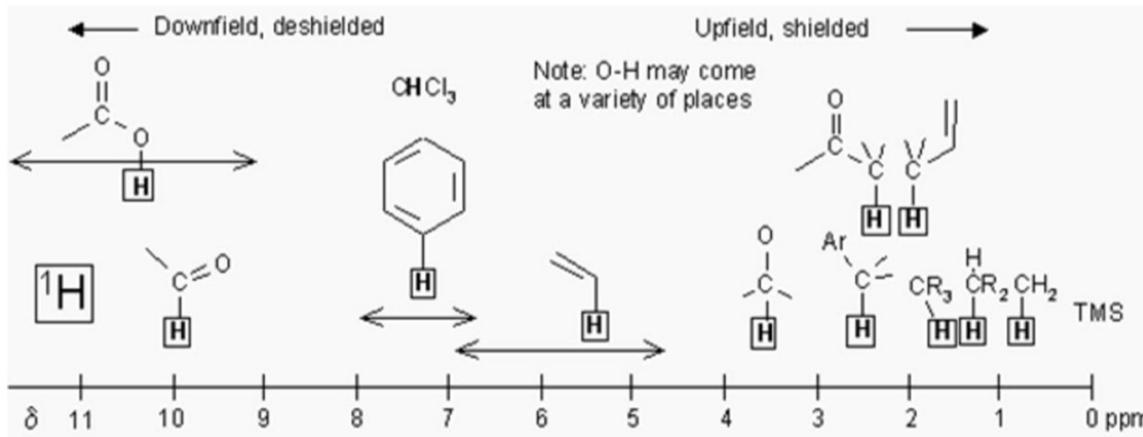

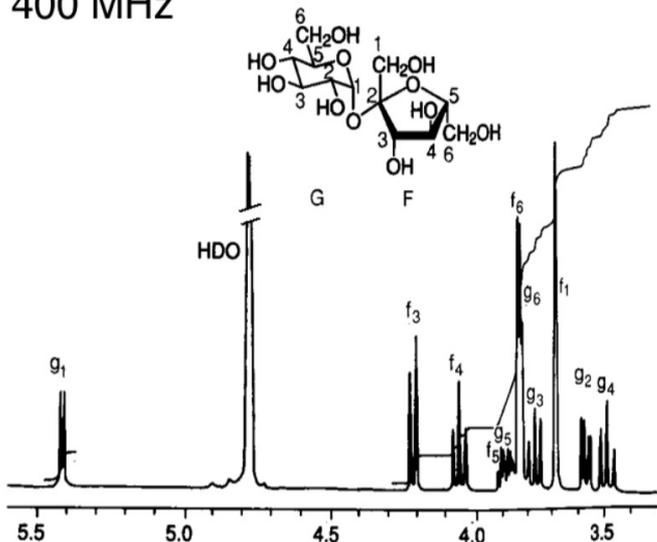

Genomics	Proteomics	Metabolomics
4 bases	20 amino acids	10 ⁵ + chemicals
Single instrument	1 - 2 instruments	multiple instruments
22,000 genes	5000 – 10,000 proteins	200 is good!

Relative abundance of metabolites requires sensitive instrumentation

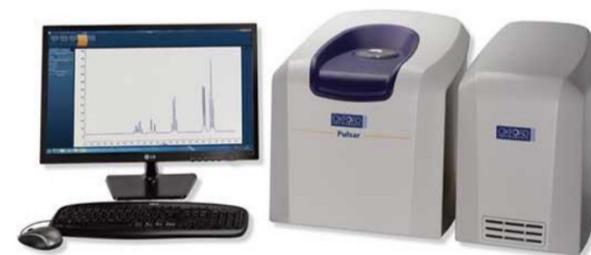

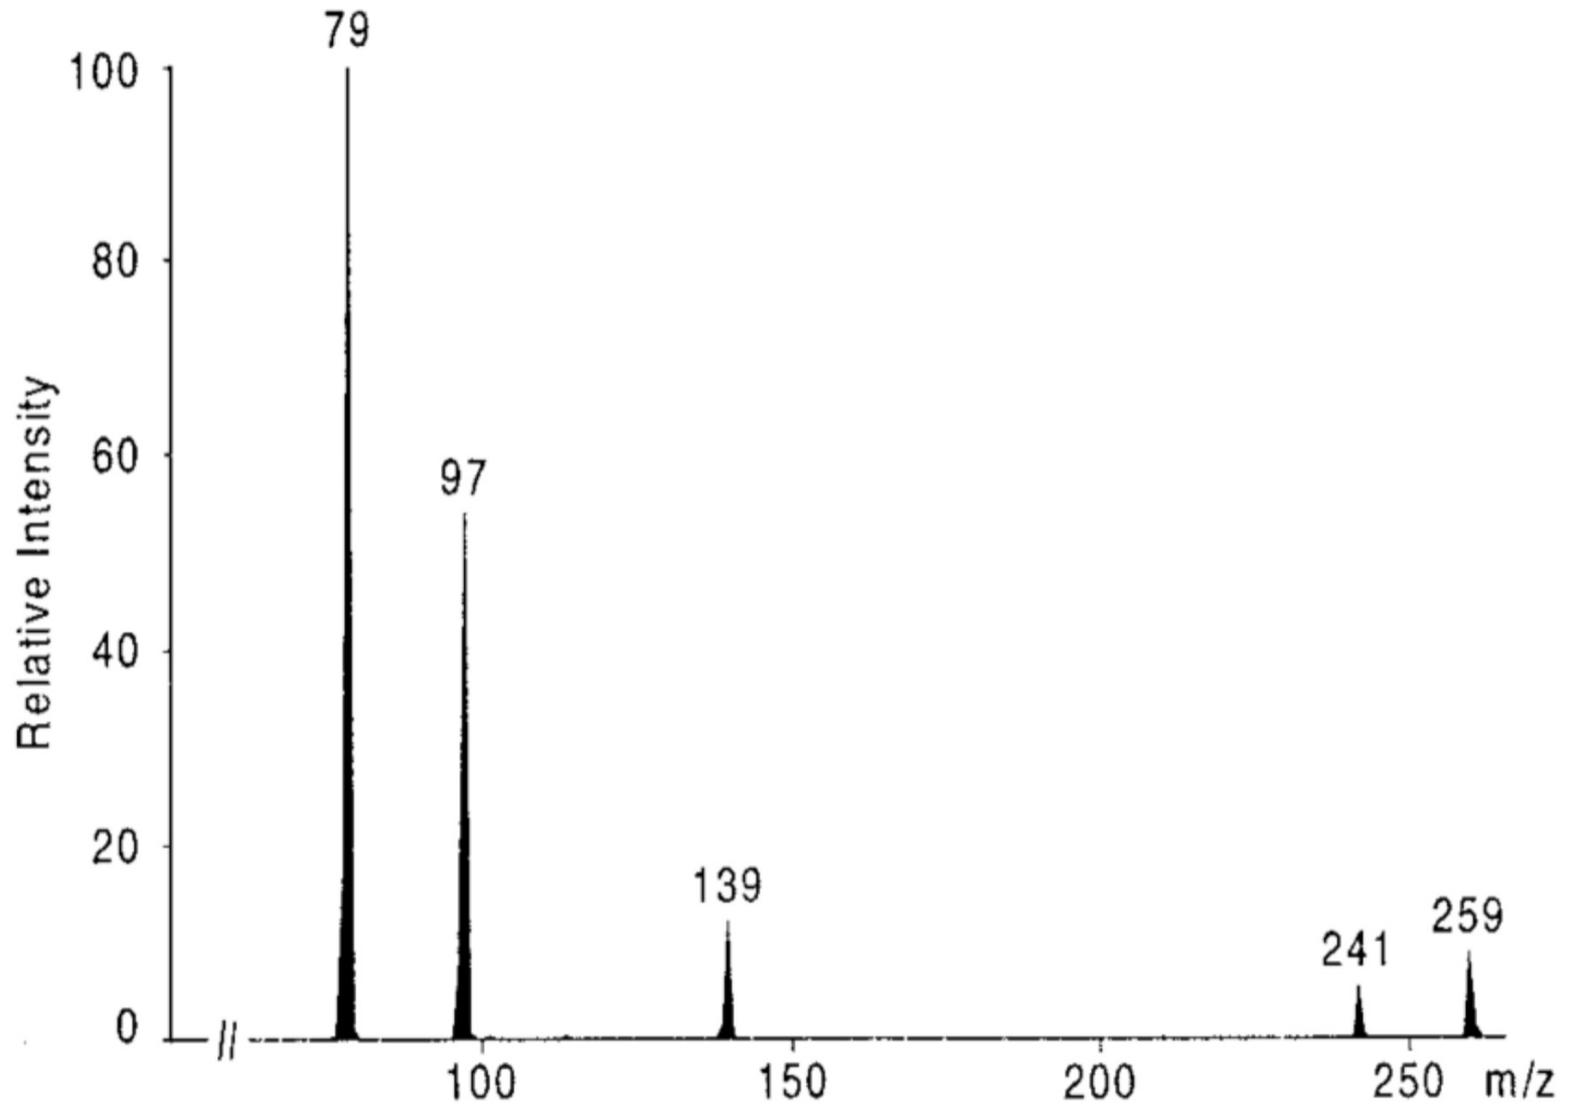

Mass spectrometry (MS) and Nuclear Magnetic Resonance (NMR) spectroscopy are the techniques most often used for metabolome profiling.

In order to:

alter our own human environment

Flux balance analysis in metabolic networks.

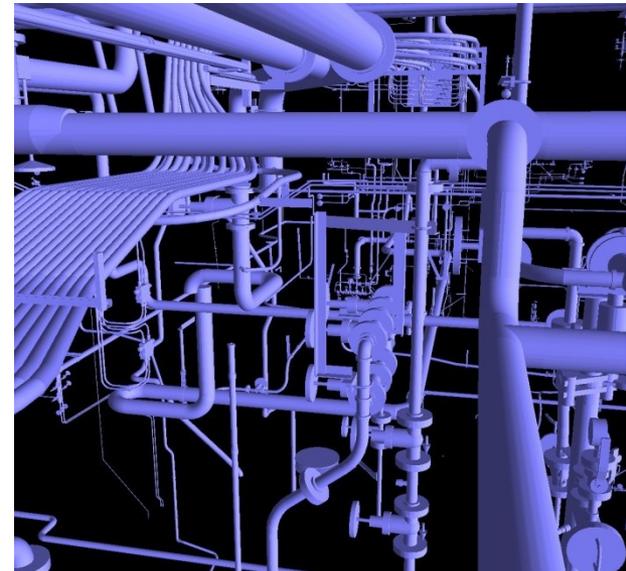

1. Metabolic networks

"Metabolism is the process involved in the maintenance of life. It is comprised of a vast repertoire of enzymatic reactions and transport processes used to convert thousands of organic compounds into the various molecules necessary to support cellular life" Kenneth et al. 2003

<http://bill.smr.arizona.edu/classes/182/CitricAcidCycle-LowRes.jpeg>

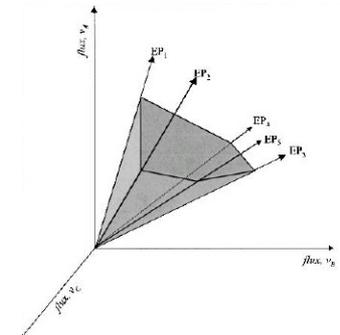

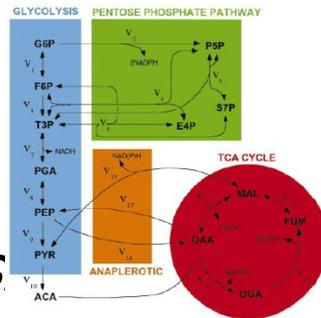

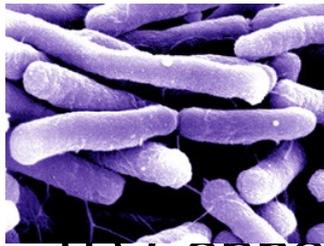

2. Flux Balance Analysis

http://images.google.com/imgres?imgurl=http://www.cs.unc.edu/~walk/models/double_eagle/pieces/pipes.jpg&imgrefurl=http://www.cs.unc.edu/~walk/models/double_eagle/pieces/8h=1095&w=1156&sz=307&tbid=1C0069b0x903&tbid=142&tbw=1508h=en&start=1&prev=/images%3Fq%3D%2Bpipes%2B%2Eh%3Den%2E%3D

Plan

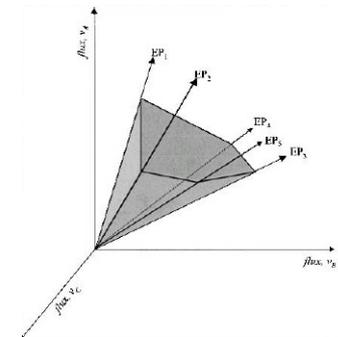

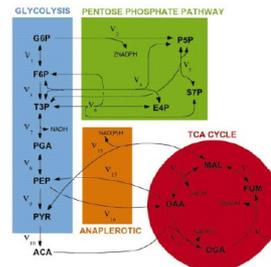

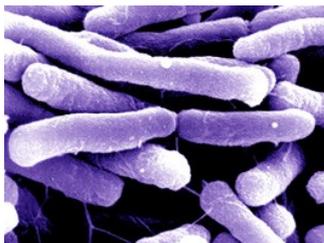

I) Creating an *in silico* model in order to describe an organisms metabolism in steady state

II) Connecting *in silico* experiments in *e. coli* to *in-vivo* experiments in *e. coli*

Segre et al. (2002)

Schilling et al. (2000)

Motivation for studying metabolic pathways

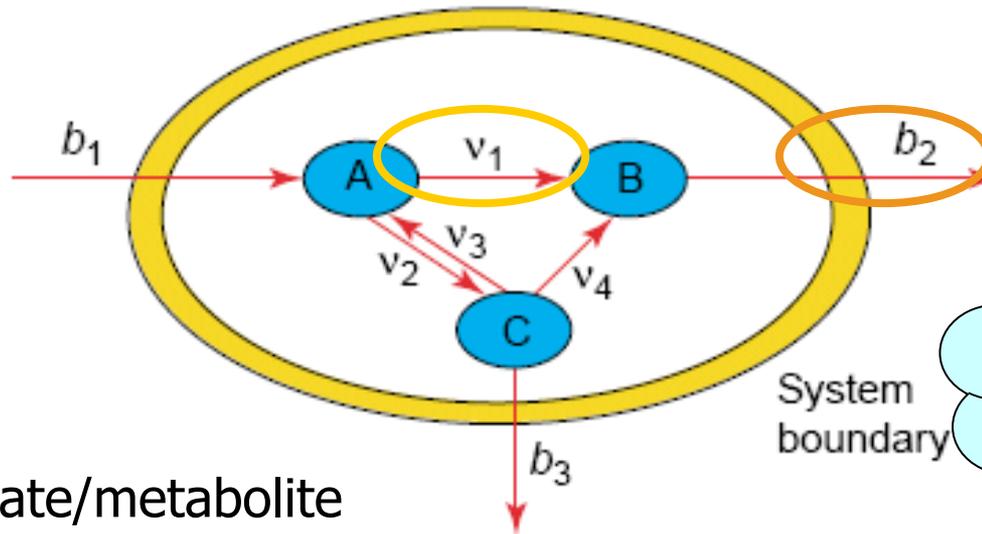

- Better understanding of cellular physiology.
- Understanding vulnerabilities of unicellular metabolism.
- Manipulation, Bio-Engineering

Constructing the model...

Step (I) - Definitions

We begin with a very simple imaginary metabolic network represented as a directed graph:

How do we define a biologically significant system boundary?

Vertex - substrate/metabolite concentration.

Edge - flux (conversion mediated by enzymes of one substrate into the other)

Internal flux edge

External flux edge

(II) - Dynamic mass balance

Concentration vector Stoichiometry Matrix Flux vector

$$\frac{dx}{dt} = S \cdot v$$

$$\frac{dA}{dt} = -v_1 - v_2 + v_3 + b_1$$

$$\frac{dB}{dt} = v_1 + v_4 - b_2$$

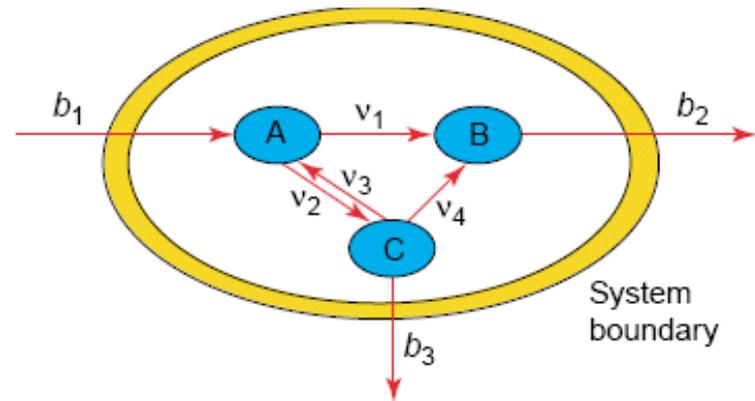

$$\frac{dC}{dt} = v_2 - v_3 - v_4 - b_3$$

$$\begin{bmatrix} \frac{dA}{dt} \\ \frac{dB}{dt} \\ \frac{dC}{dt} \end{bmatrix} = \begin{bmatrix} -1 & -1 & 1 & 0 & 1 & 0 & 0 \\ 1 & 0 & 0 & 1 & 0 & -1 & 0 \\ 0 & 1 & -1 & -1 & 0 & 0 & -1 \end{bmatrix} \begin{bmatrix} v_1 \\ v_2 \\ v_3 \\ v_4 \\ b_1 \\ b_2 \\ b_3 \end{bmatrix}$$

← s →

 $\begin{matrix} \uparrow \\ v_1 \\ v_2 \\ v_3 \\ v_4 \\ \downarrow \\ b_1 \\ b_2 \\ b_3 \end{matrix}$

v

(II) - Dynamic mass balance

Concentration vector Stoichiometry Matrix Flux vector

$$\frac{dx}{dt} = S \cdot v$$

Solution !

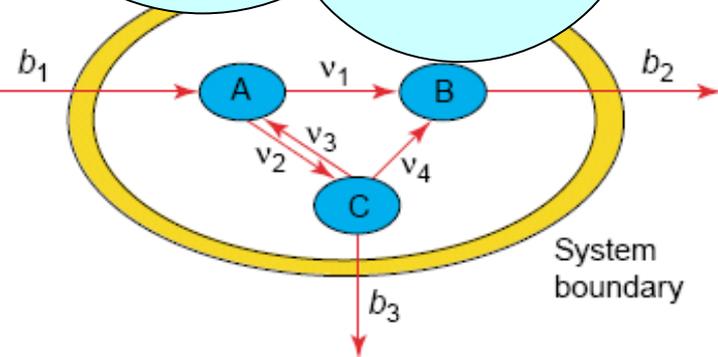

In order to identify invariant characteristics of the network we assume the network is at **steady state**.

Problem ...

$V=V(k_1, k_2, k_3...)$ is actually a function of concentration as well as several kinetic parameters.

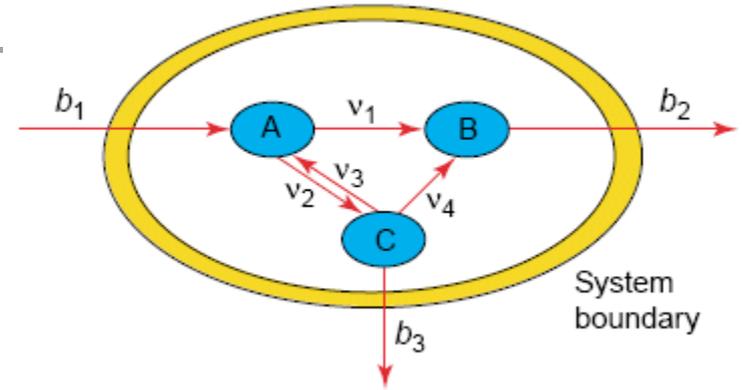

it is very difficult determine kinetic parameters experimentally.

Consequently there is not enough kinetic information in the literature to construct the model.

(III) - Dynamic mass balance at steady state

1. What does “steady state” mean?
2. Is it biologically justifiable to assume it?
3. Does it limit the predictive power of our model?
4. Most important question...

“The steady state approximation is generally valid because of fast equilibration of metabolite concentrations (**seconds**) with respect to the time scale of genetic regulation (**minutes**)” – Segre 2002

Yes...

4. Why does the steady state assumption help us solve our problem?

$$\frac{dx}{dt} = S \cdot v \quad \xrightarrow{\text{Steady state assumption}} \quad 0 = S \cdot v$$

Steady state assumption

$$\begin{bmatrix} \frac{dA}{dt} \\ \frac{dB}{dt} \\ \frac{dC}{dt} \end{bmatrix} = \begin{bmatrix} -1 & -1 & 1 & 0 & 1 & 0 & 0 \\ 1 & 0 & 0 & 1 & 0 & -1 & 0 \\ 0 & 1 & -1 & -1 & 0 & 0 & -1 \end{bmatrix} \begin{bmatrix} v_1 \\ v_2 \\ v_3 \\ v_4 \\ b_1 \\ b_2 \\ b_3 \end{bmatrix} \quad \begin{matrix} \uparrow \\ \uparrow \\ \uparrow \\ \uparrow \\ \downarrow \\ \downarrow \\ \downarrow \end{matrix} \mathbf{V}$$

$\leftarrow \mathbf{s} \rightarrow$

$$\begin{pmatrix} 0 \\ 0 \\ 0 \end{pmatrix} = \begin{bmatrix} -1 & -1 & 1 & 0 & 1 & 0 & 0 \\ 1 & 0 & 0 & 1 & 0 & -1 & 0 \\ 0 & 1 & -1 & -1 & 0 & 0 & -1 \end{bmatrix} \begin{bmatrix} v_1 \\ v_2 \\ v_3 \\ v_4 \\ b_1 \\ b_2 \\ b_3 \end{bmatrix} \quad \begin{matrix} \uparrow \\ \uparrow \\ \uparrow \\ \uparrow \\ \downarrow \\ \downarrow \\ \downarrow \end{matrix} \mathbf{V}$$

$\leftarrow \mathbf{s} \rightarrow$

(VI) adding constraints

Constraints on internal fluxes:

$$v_i \geq 0,$$

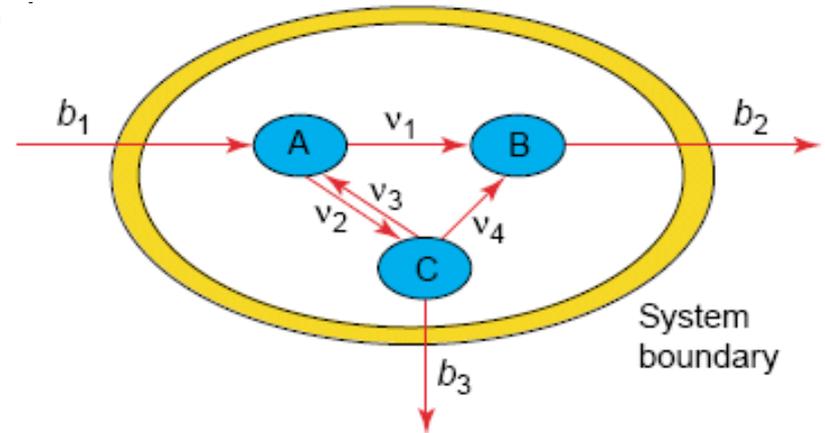

Constraints on external fluxes:

Source $b_j \leq 0$

Sink $b_j \geq 0$

Sink/source b_j is unconstrained

In other words flux going into the system is negative while flux leaving the system is considered positive.

Remark: later on we will impose further constraints both on the internal flux as well as the external flux...

(V) Flux cone and metabolic capabilities

$$0 = S \cdot v$$

$$\begin{pmatrix} 0 \\ 0 \\ 0 \\ 0 \end{pmatrix} = \begin{bmatrix} -1 & -1 & 1 & 0 & 1 & 0 & 0 \\ 1 & 0 & 0 & 1 & 0 & -1 & 0 \\ 0 & 1 & -1 & -1 & 0 & 0 & -1 \end{bmatrix} \begin{pmatrix} v_1 \\ v_2 \\ v_3 \\ v_4 \\ b_1 \\ b_2 \\ b_3 \end{pmatrix}$$

← s →
↑ v ↓

Observation: the number of reactions considerably exceeds the number of metabolites

The S matrix will have more columns than rows

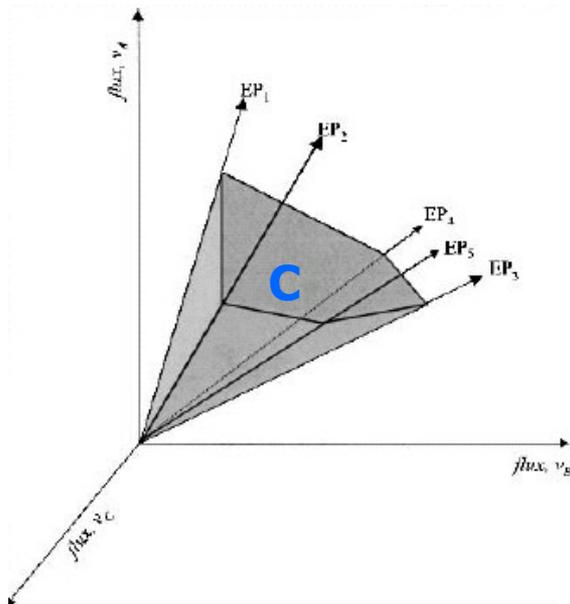

The null space of viable solutions to our linear set of equations contains an infinite number of solutions.

What about the constraints?

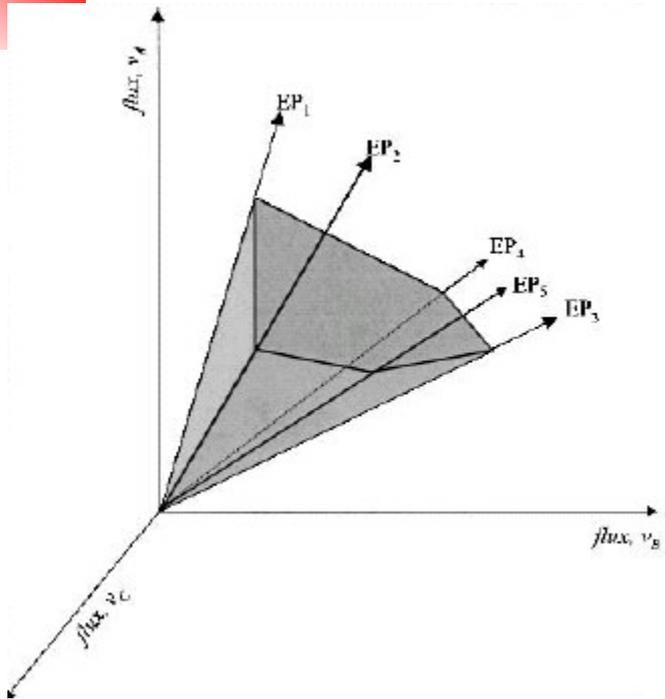

“The solution space for any system of linear homogeneous equations and inequalities is a **convex polyhedral cone**.” - Schilling 2000

Our flux cone contains all the points of the null space with non negative coordinates (besides exchange fluxes that are constrained to be negative or unconstrained)

(V) Flux cone and metabolic capabilities

What is the significance of the flux cone?

- It defines what the network can do and cannot do!
- Each point in this cone represents a flux distribution in which the system can operate at steady state.
- The answers to the following questions (and many more) are found within this cone:
 - what are the building blocks that the network can manufacture?
 - how efficient is energy conversion?
 - Where is the critical links in the system?

(VI) Navigating through the flux cone – using “Extreme pathways”

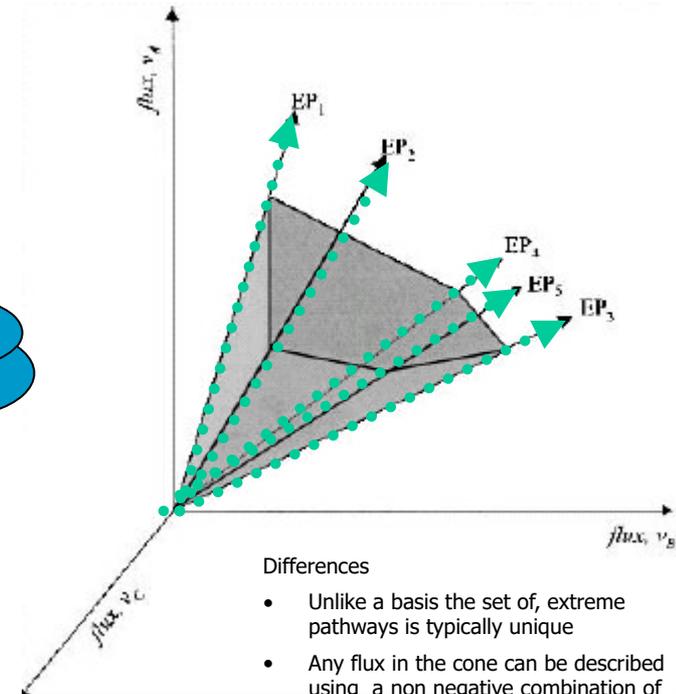

Next thing to do is develop a way to describe and interpret any location within this space.

- We will not use the traditional reaction/enzyme based perspective
- Instead we use a pathway perspective:

Extreme rays - “extreme rays correspond to edges of the cone. They are said to generate the cone and cannot be decomposed into non-trivial combinations of any other vector in the cone.”- schilling 2000 •••

What is the analogy in linear algebra?

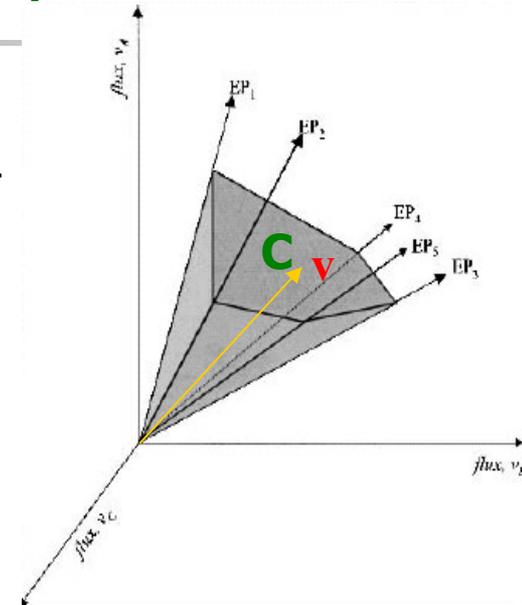

We use the term **Extreme Pathways** when referring to **Extreme rays** of a convex polyhedral cone that represents metabolic fluxes

(VI) Navigating through the flux cone – using “Extreme pathways”

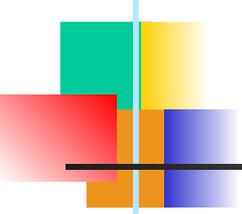

- Extreme Pathways will be denoted by vector EP_i ($0 \leq i \leq k$)
- Every point within the cone can be written as a non-negative linear combination of the extreme pathways.

$$C = \{v \mid v = \sum_{i=1}^k w_i EP_i, w_i \geq 0 \forall i\}$$

In biological context this *means that* :

any steady state flux distribution can be represented by a non-negative linear combination of extreme pathways.

Example

Lets look at a specific vector v' :

$$v = \begin{bmatrix} 4 \\ 2 \\ 0 \\ 1 \\ 0 \\ 1 \\ -4 \\ 2 \\ 1 \\ 1 \end{bmatrix}$$

Is v inside the flux cone?

Easy to check...

1. Does v fulfill constraints?

2. Is v in the null space of $Sv=0$?

$$\begin{bmatrix} -1 & 0 & 0 & 0 & 0 & 0 & -1 & 0 & 0 & 0 \\ 1 & -1 & 1 & 0 & 0 & 0 & 0 & -1 & 0 & 0 \\ 0 & 1 & -1 & -1 & 1 & -1 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 1 & -1 & 0 & 0 & 0 & -1 & 0 \\ 0 & 0 & 0 & 0 & 0 & 1 & 0 & 0 & 0 & -1 \end{bmatrix} \begin{bmatrix} 4 \\ 2 \\ 0 \\ 1 \\ 0 \\ 1 \\ -4 \\ 2 \\ 1 \\ 1 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \\ 0 \\ 0 \end{bmatrix}$$

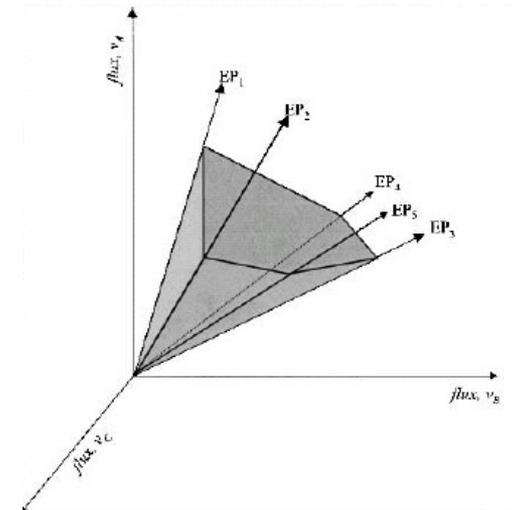

(I) Narrowing the steady state flux cone

- The steady state flux cone contains an **infinite flux distributions!**
- Only a small portion of them is **physiologically feasible.**
- More constraints on the external fluxes.

These depend on factors as:

- Organism
- Environment and accessibility substrates
- maximum rates of diffusion mediated transport
- Etc...

(II) Calculating optimal flux distribution

- The constrained flux cone in E.coli contains $\sim 10^6$ (Schilling 2001)
- How can we identify a “biologically meaningful” flux?

Assumption...

the metabolic network is optimized with respect to a certain objective function Z.

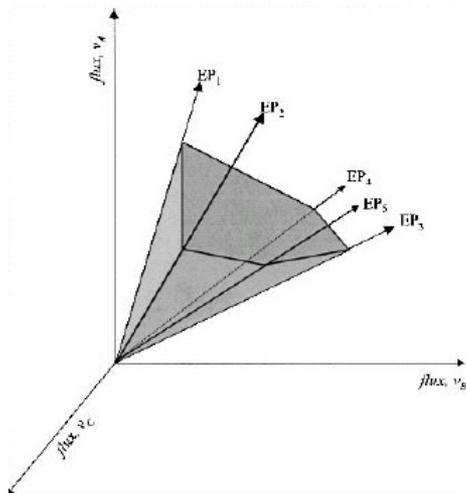

Z will be a linear function. Later, we will deal with how exactly to choose Z

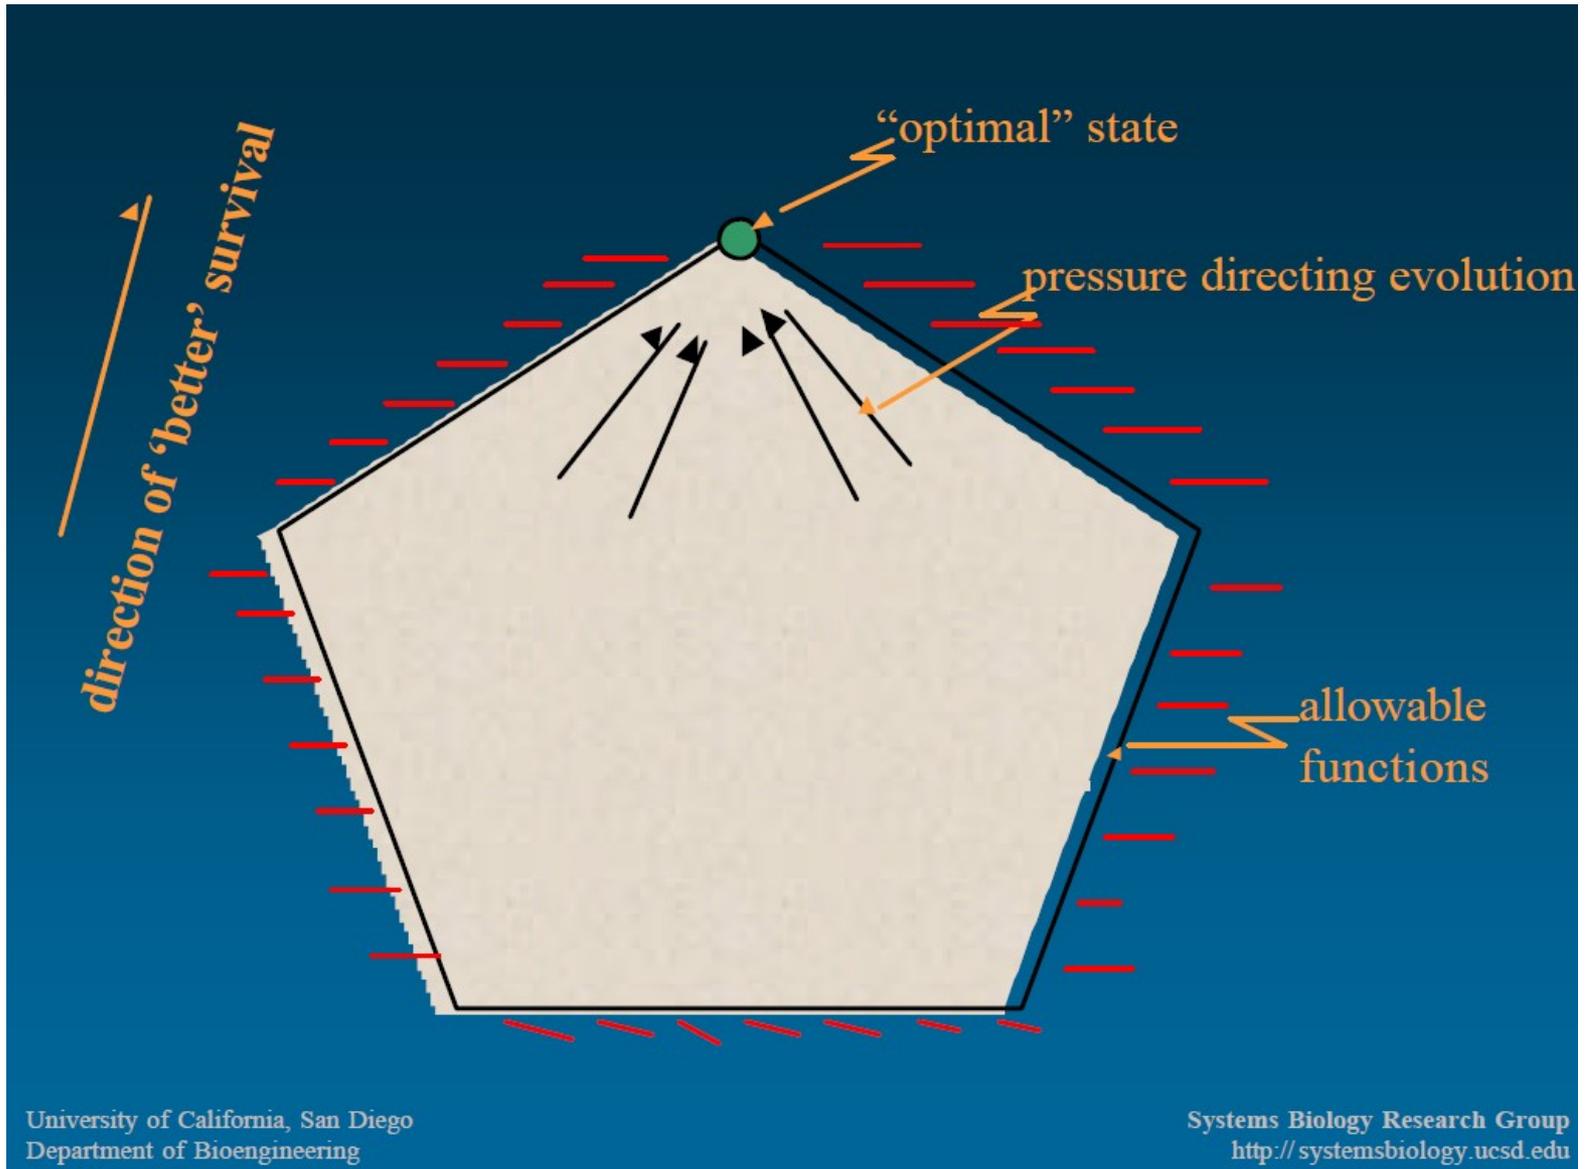

What we want to do is find the vector v in the flux cone which maximizes Z .

...this can be formulated as an optimization problem:

$$\text{Minimize/Maximize } Z = \sum_j c_j v_j \text{ such that } S \cdot v = 0 \text{ + inequality constraints}$$

This optimization problem is a classical linear programming (**LP**) problem that can be solved using the simplex algorithm. W. Wiechert . Journal of biotechnology(2002)

Linear Programming: What is it?

finding an optimal solution in a confined space

(III) How to choose the objective function Z

We want to choose a Z that is biologically meaningful.

Reasonable options could be:

1. Z: Cellular growth (maximization)
2. Z: Particular metabolite engineering (maximization)
3. Z: Energy consumption (minimization)

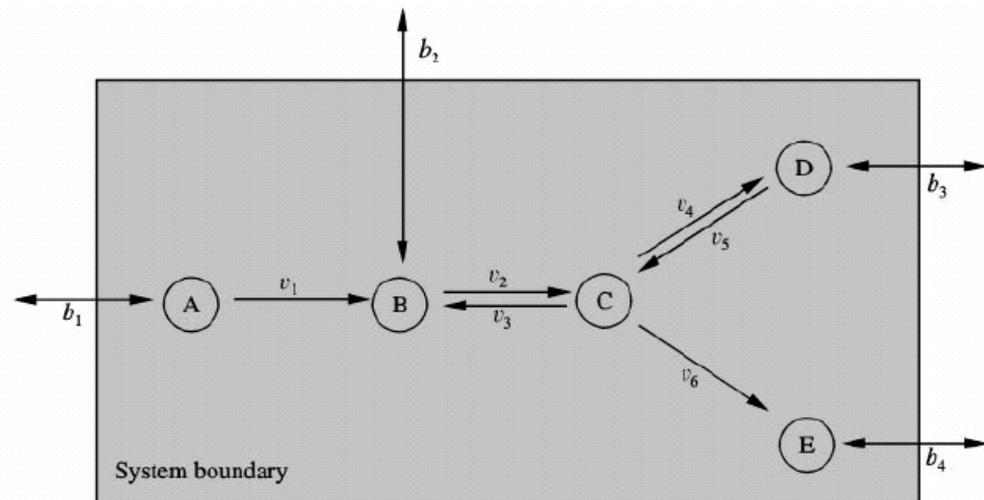

Example:

cellular growth is correlated with the production of B,D and 2E.

We want a v that:

(A) Resides in side the cone.

(B) **maximizes $Z=B+D+2E$.**

(III) How to choose the objective function Z

1. "It has been shown that under rich growth conditions (i.e. no lack of phosphate and nitrogen), *E. Coli* grows in a stoichiometrically optimal manner." (Schilling 2001, Edwards 1994)
2. "It is reasonable to hypothesize that unicellular organisms have evolved toward maximal growth performance." (Segre, 2002.)

We shall use Z which reflects:

Cellular Growth

The growth requirements

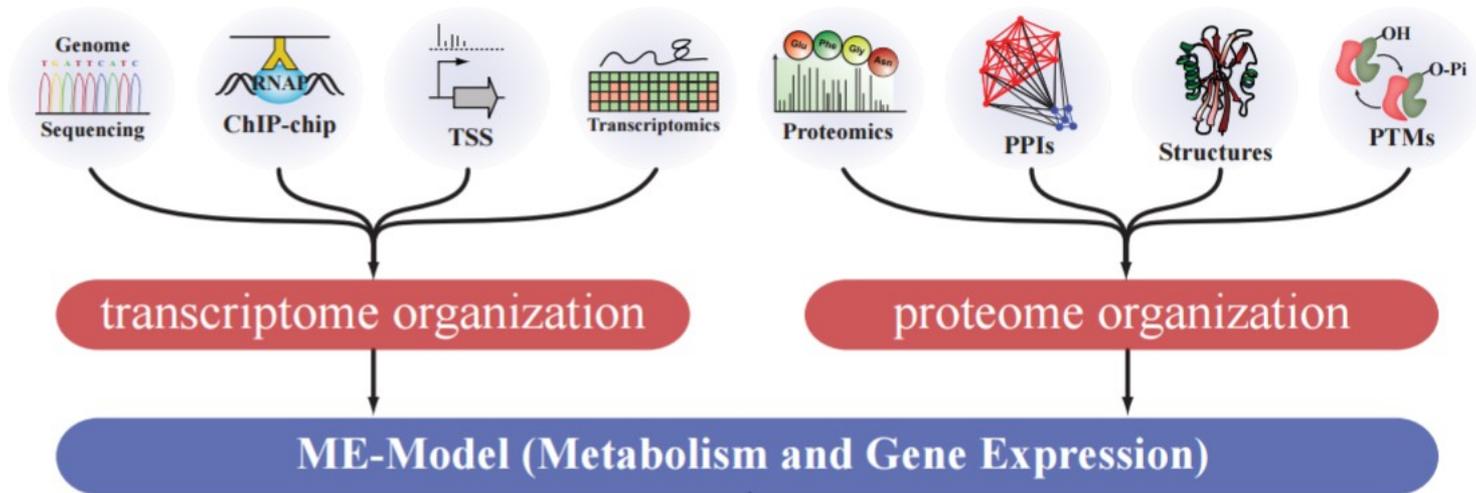

Metabolic demands of precursors and cofactors required for 1 g of biomass of *E. coli*.

These precursors are removed from the metabolic network in the corresponding ratios.

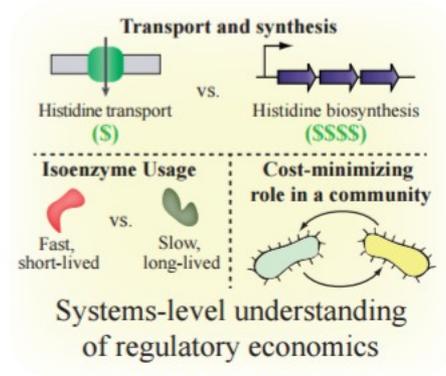

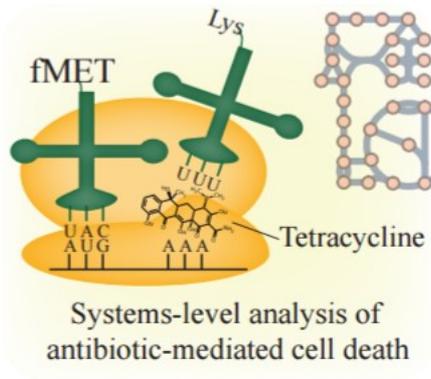

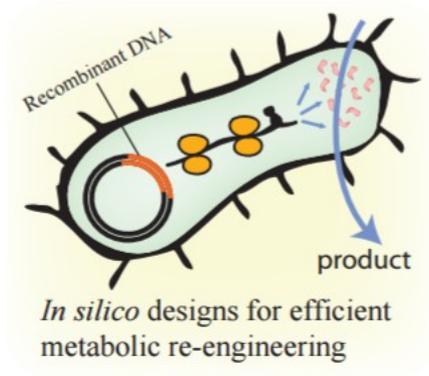

Thus, the objective function is:

$$Z = 41.2570 v_{\text{ATP}} - 3.547 v_{\text{NADH}} + 18.225 v_{\text{NADPH}} + \dots$$

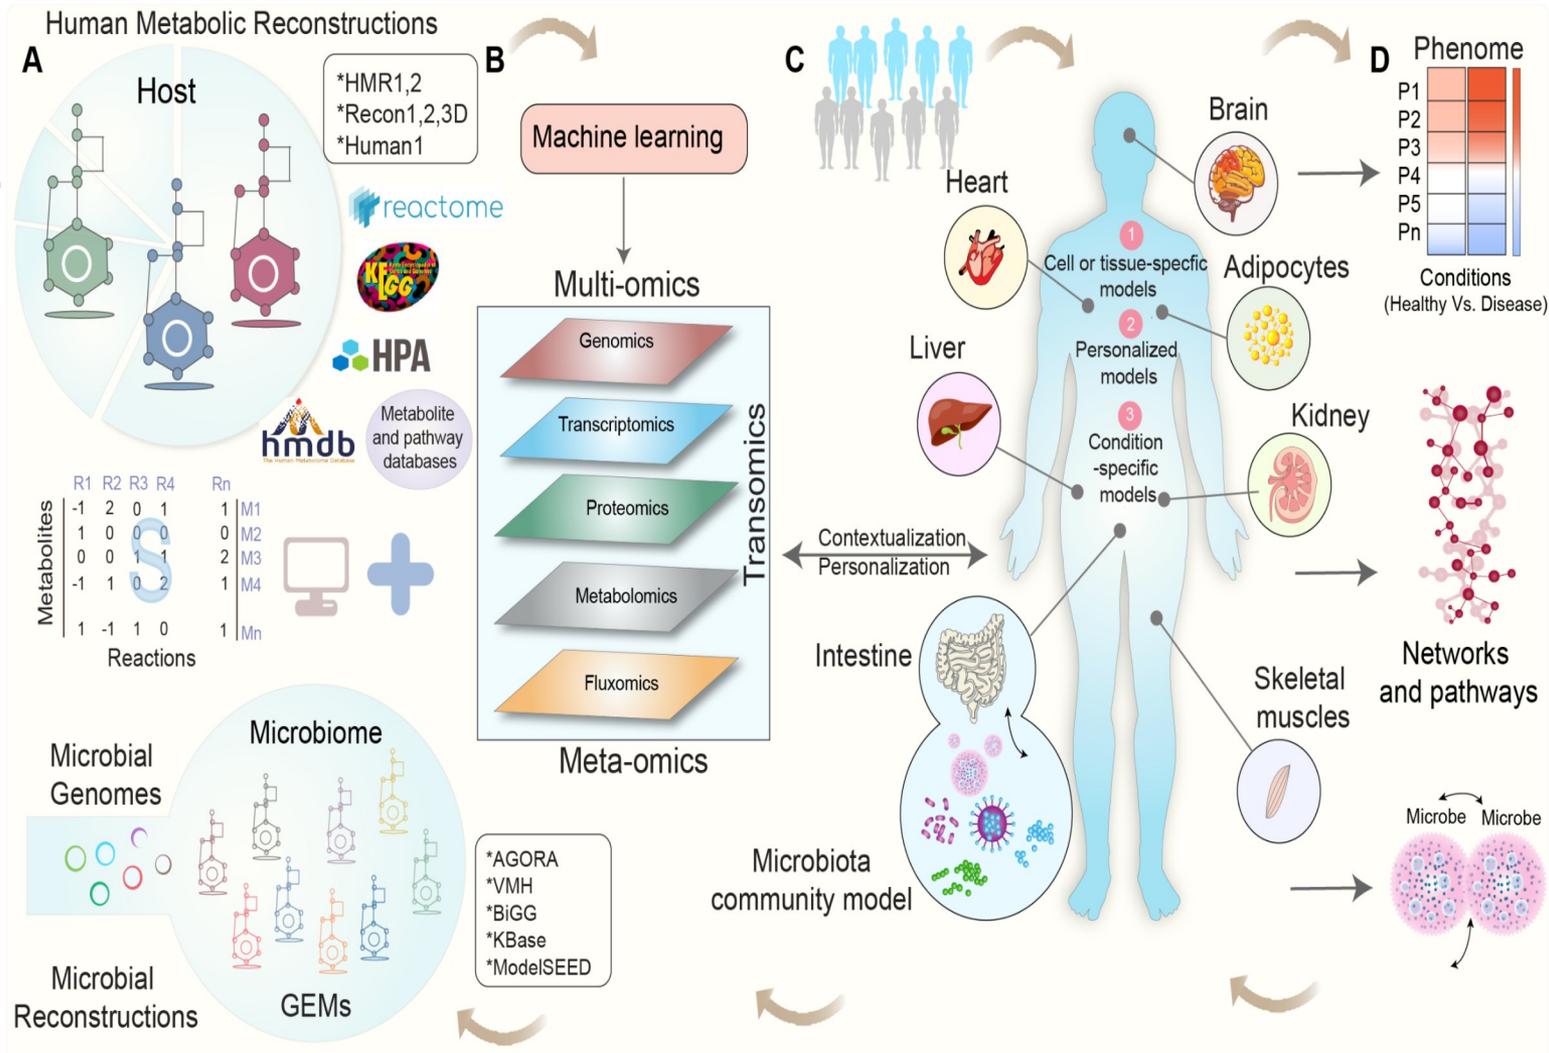

Metabolite	Demand
	(mmol)
ATP	41.2570
NADH	-3.5470
NADPH	18.2250
G6P	0.2050
F6P	0.0709
R5P	0.8977
E4P	0.3610
T3P	0.1290
3PG	1.4960
PEP	0.5191
PYR	2.8328
AcCoA	3.7478
OAA	1.7867
AKG	1.0789

(IV) Phenotype phase planes- PPP

Predicting cellular growth

X axis – Succinate uptake rate

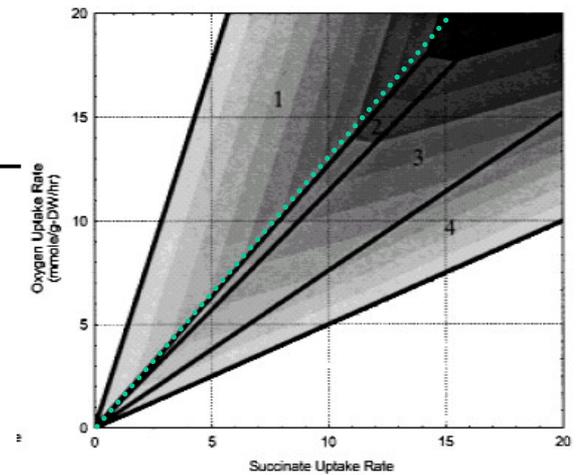

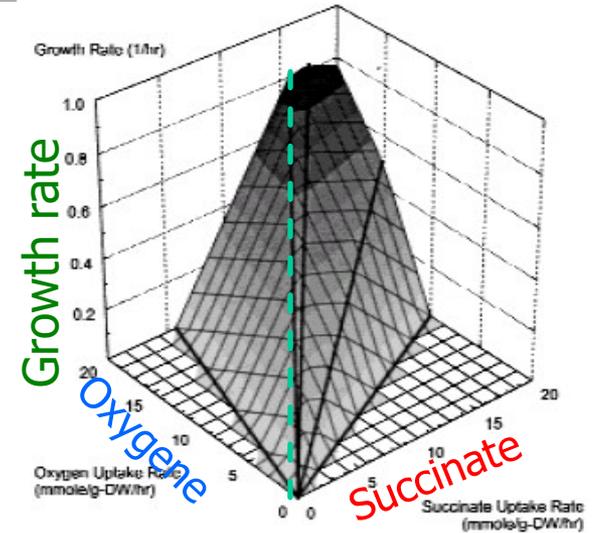

Y axis – Oxygene uptake rate

Z axis - Growth rate (maximal value of the objective function as function of succinate and oxygen uptake)

Observations:

- Metabolic network is unable to utilize succinate as sole carbon source in anaerobic conditinos.
- **Region 1:** oxygen excess – this region is wasteful – (less carbon is available for biomass production since it is oxidized to eliminate the excess oxygen.)
- **Line of optimality**

Schilling 2001

(IV) Phenotype phase planes- PPP

Predicting cellular growth

X axis – Succinate uptake rate

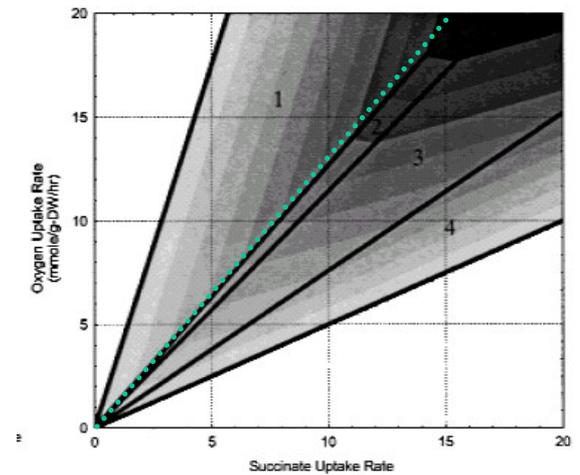

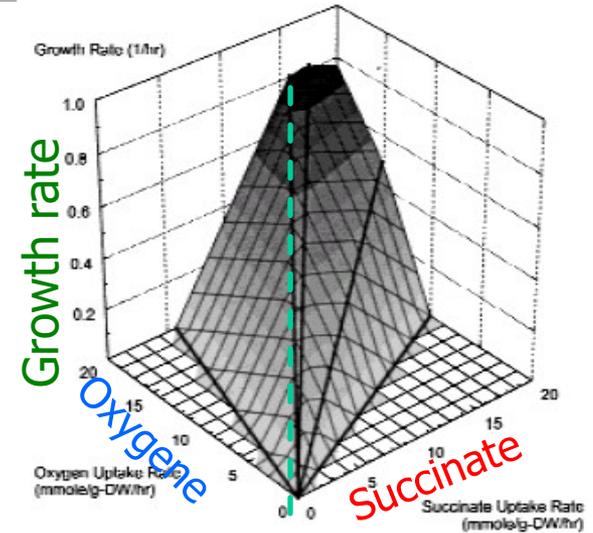

Y axis – Oxygene uptake rate

Z axis - Growth rate (maximal value of the objective function as function of succinate and oxygen uptake)

Observations:

- **Region 2** – limitation on both oxygen and succinate
- **Region 3**- the uptake of additional succinate has a negative effect. Cellular resources are required to eliminate excessive succinate.

Schilling 2001

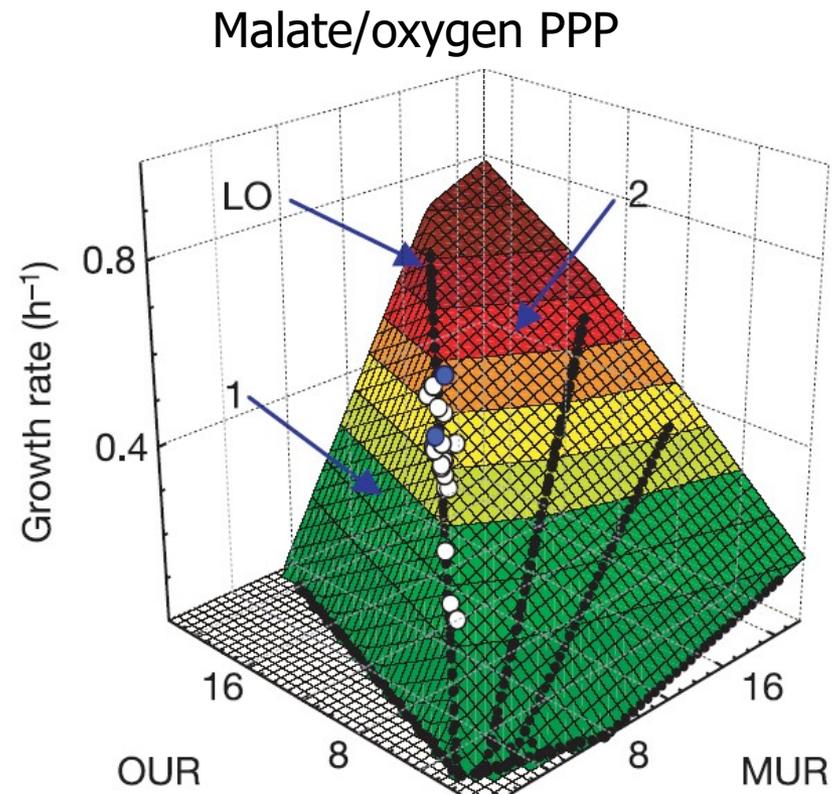

Model vs. biological experiments

Does *E. coli* behave according to optimal behavior predictions?

- *E. coli* was grown with malate as sole carbon source.
- A range of substrate concentrations and temperatures were used in order to vary the malate uptake rate (MUR).
- Oxygen uptake rate (OUR) and growth rate were measured
 -
 -
 -

Does E. coli behave according to optimal behavior predictions?

1- The experimentally determined growth rate were on the line of optimality of the PPP !

Ibarra et al., Nature 2002

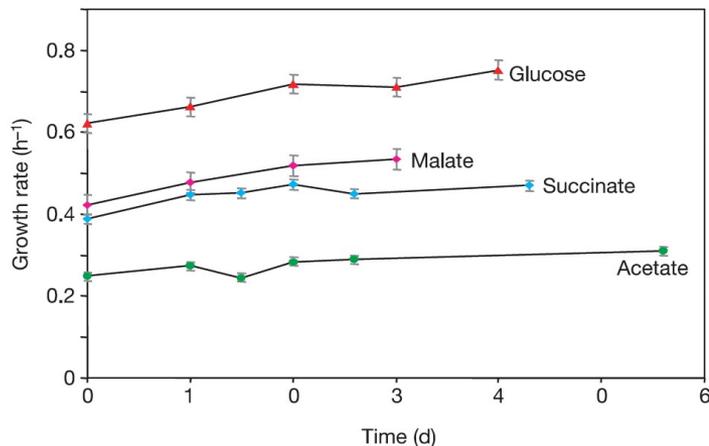

Does E. coli behave according to optimal behavior predictions?

Is the optimal performance on malate stable over prolonged periods of time?

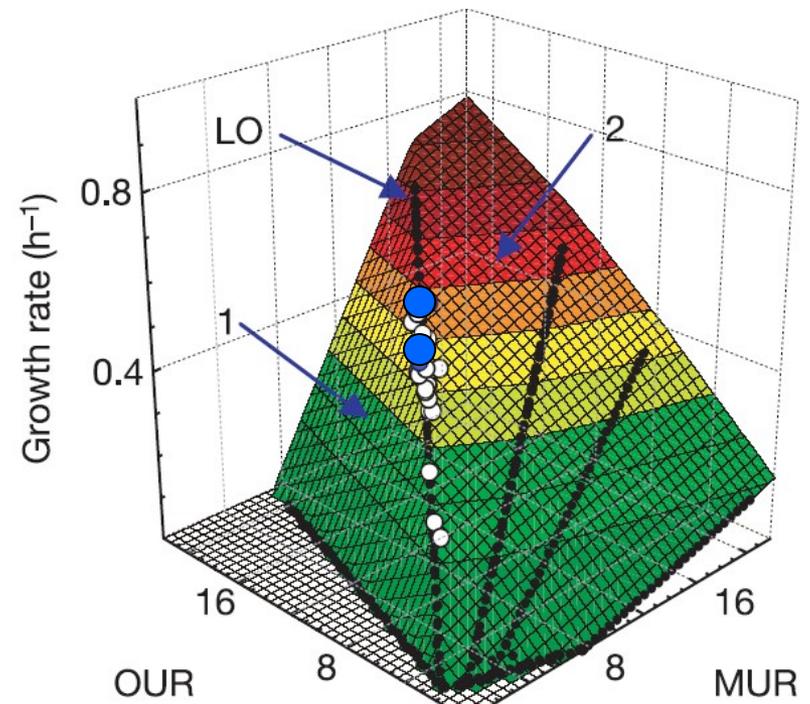

Evolution of E. coli on malate was studied for 500 generations in a single condition...

2- An adaptive evolution was observed with an increase of 19% in growth rate!

3- Same adaptive evolution was observed for succinate and Malate!

Malate/oxygen PPP

Ibarra et al., Nature 2002

Does *E. coli* behave according to optimal behavior predictions?

Same experiments were made using glycerol as sole carbon source

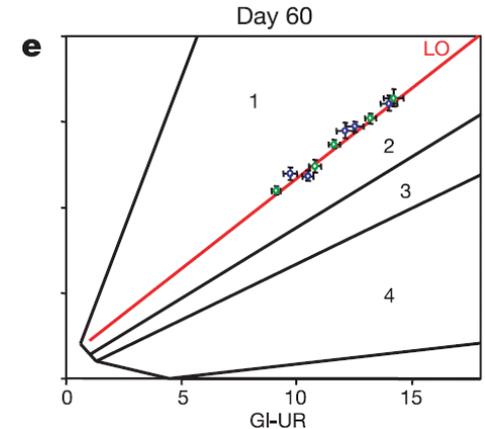

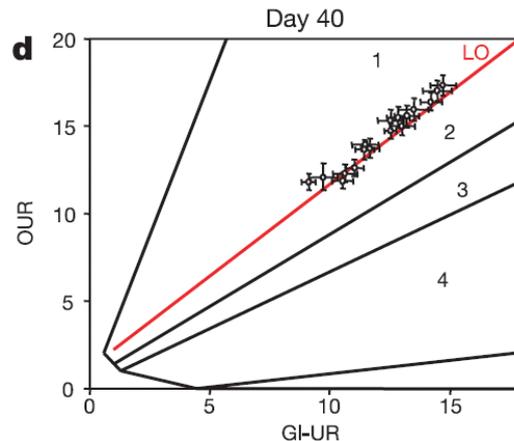

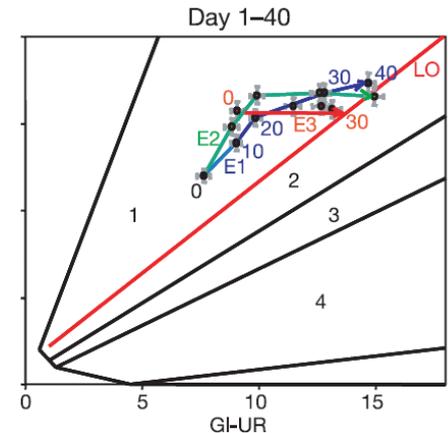

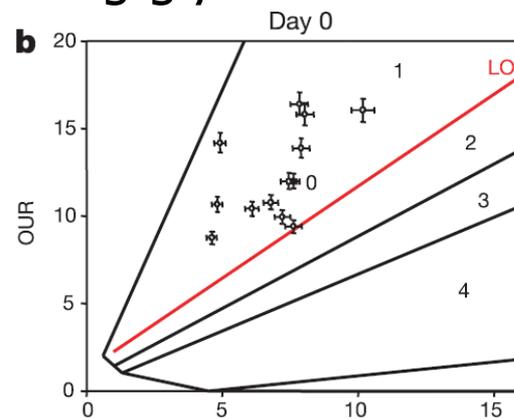

Day 0 – Sub optimal growth

Why?

Day 1-40 – evolution toward optimal growth

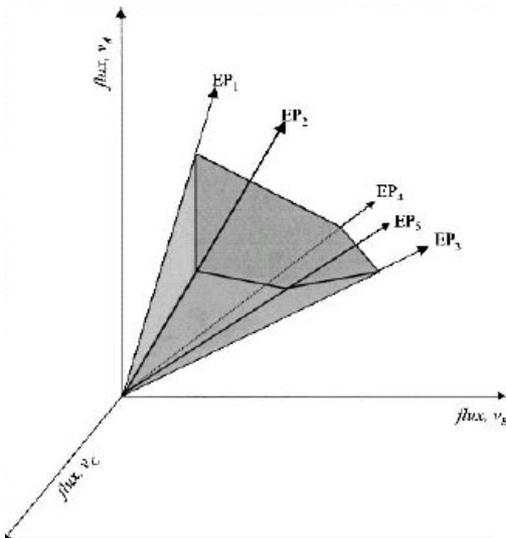

Day 40 – optimal growth

Day 60 – optimal growth (no change)

Considering instances where FBA predictions are inaccurate... **MOMA**

- What happens to the metabolism in the case of a mutation/genetically engineered bacteria?
- What happens in terms of the flux cone?

$$0 = S \cdot v$$

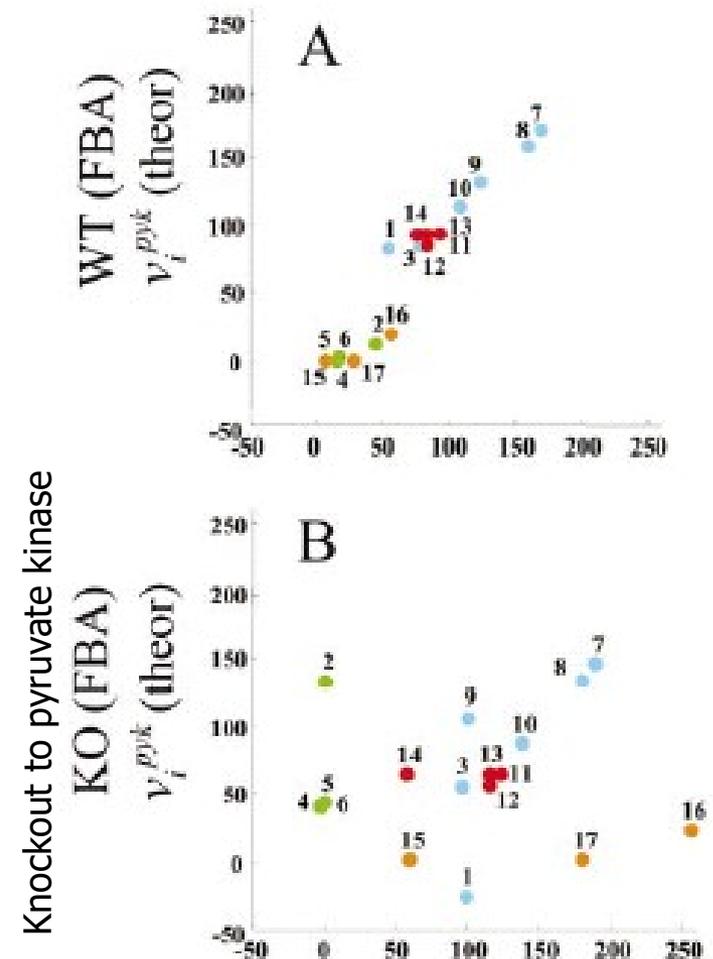

$$\begin{pmatrix} 0 \\ 0 \\ 0 \end{pmatrix} = \begin{bmatrix} -1 & -1 & 1 & 0 & 1 & 0 & 0 \\ 1 & 0 & 0 & 1 & 0 & -1 & 0 \\ 0 & 1 & -1 & -1 & 0 & 0 & -1 \end{bmatrix} \begin{bmatrix} v_1 \\ 0 \\ v_3 \\ v_4 \\ 0 \\ b_2 \\ b_3 \end{bmatrix}$$

\leftarrow s \rightarrow

\updownarrow v \updownarrow

Considering instances where FBA predictions are inaccurate...

- FBA – assumes **optimality of growth** for wild type
- This assumption is **not necessarily correct** some instances...

Considering instances where FBA predictions are inaccurate... **MOMA**

- Is there any other objective function Z that can capture the biological essence of these mutations?
- Perhaps another model...

MOMA - minimization of metabolic adjustments

[Segre, Vituk and Church 2002]

MOMA

- Uses the same steady state flux cone as FBA.
- Relaxes the assumption of maximal optimal growth.
- a mutant is likely to display a suboptimal flux distribution between wild-type optimum and mutant optimum.

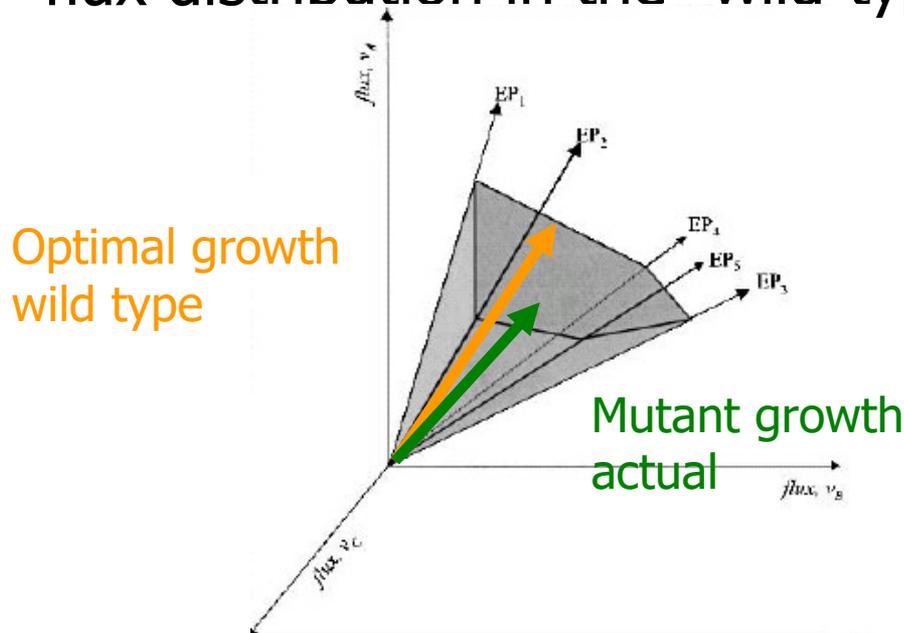

How does **MOMA** work?

- **Assumption – “Initially , the mutant remains as close as possible to the wild-type optimum in terms of flux values.”**

How does MOMA work?

- In other words:
MOMA searches for the flux distribution in the “mutant flux space” which is closest to the optimal flux distribution in the “wild-type flux space”.

How does **MOMA** work?

Formally:

V^{wt} – the wild-type optimal growth vector.

V^m – a vector in mutant flux space.

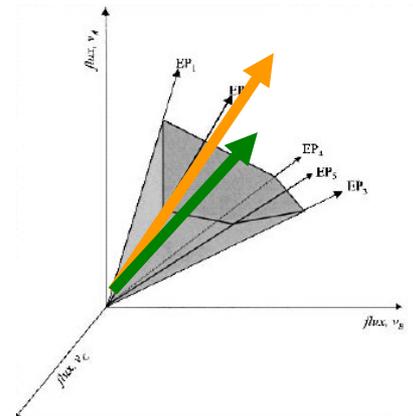

Find V^m which minimizes the Euclidian distance to V^{wt} :

$$D(V^m, V^{wt}) = \sqrt{\sum_{i=1}^n (V_i^m - V_i^{wt})^2}$$

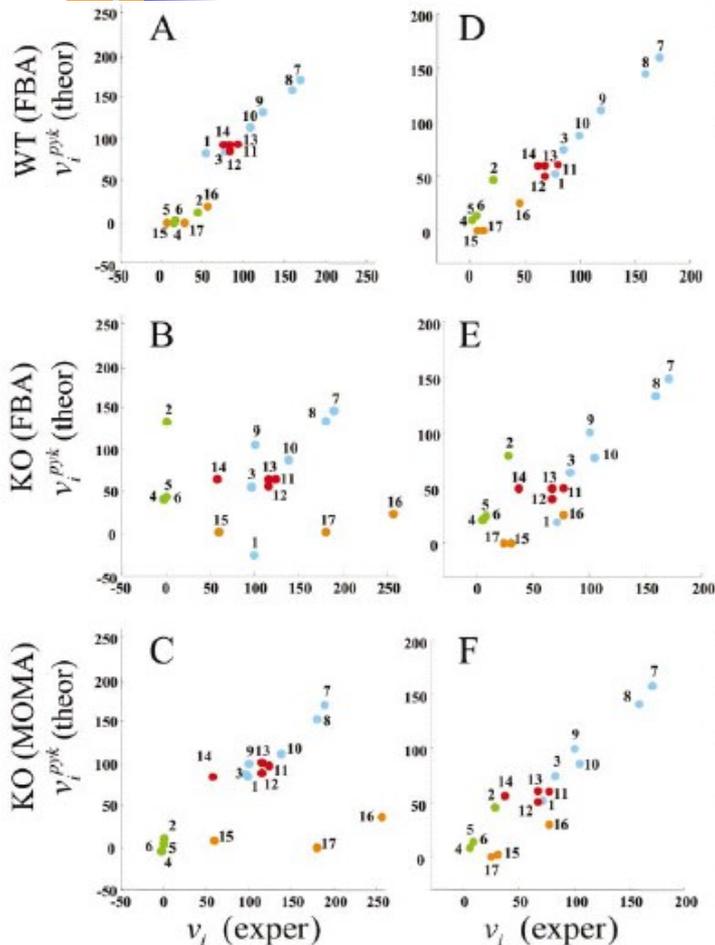

This can be stated as a QP problem. That is, minimize

$$f(x) = L \cdot x + \frac{1}{2} x^T Q x$$

Under a set of linear constraints.

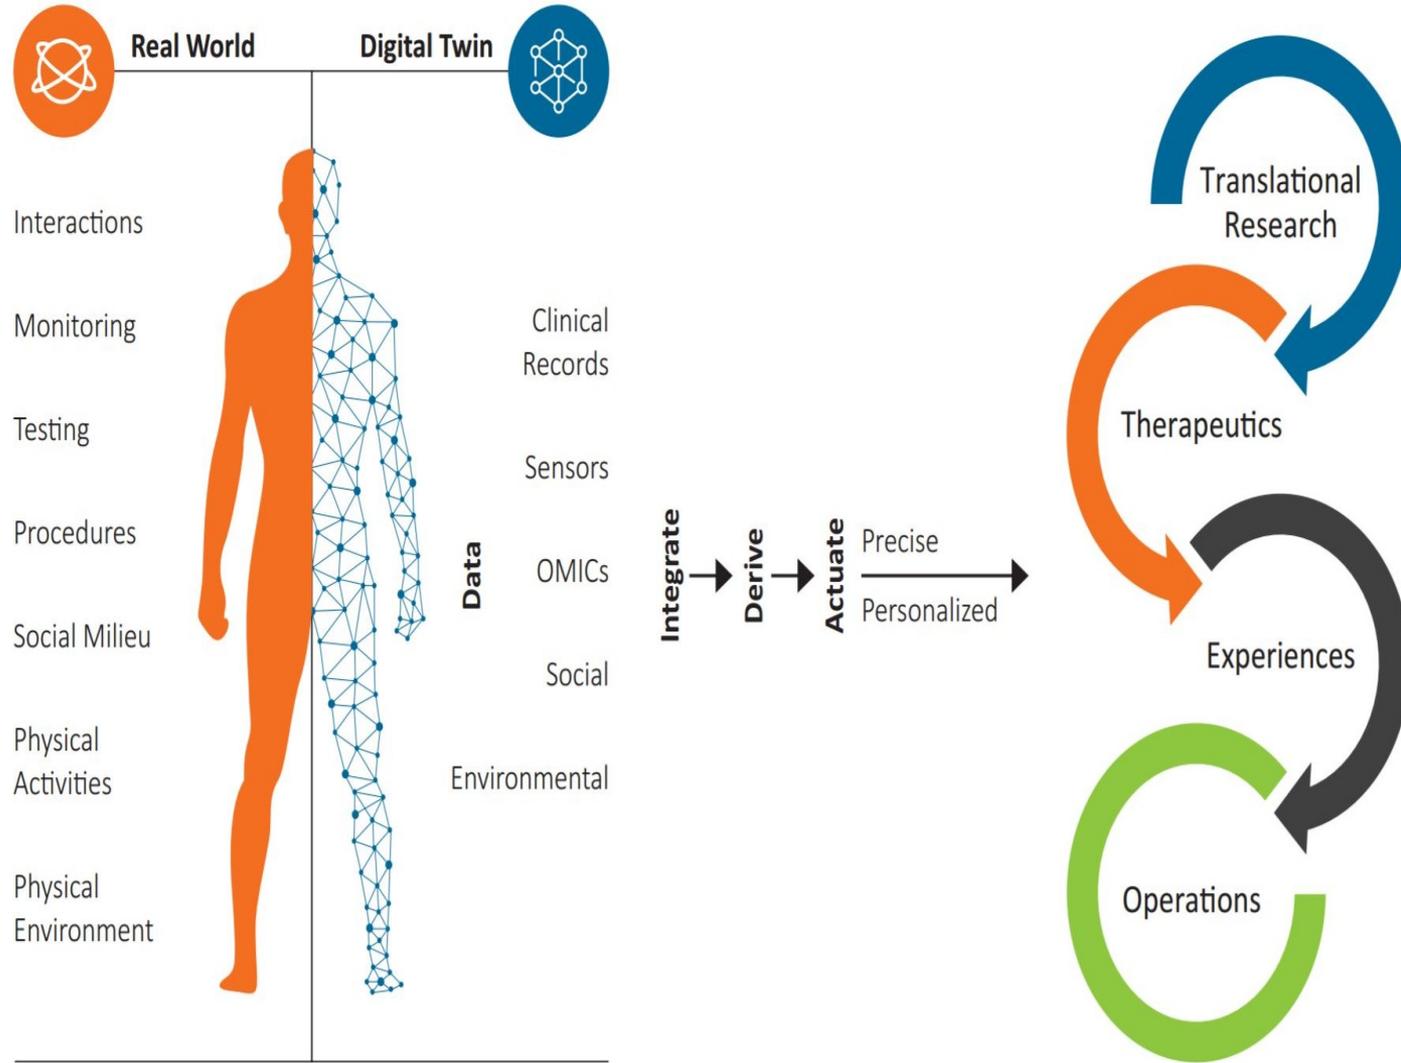

Comparing MOMA and FBA on mutant strains

Condition	Method	Absolute		
		ρ_1	P value (a)	P value (b)
C-0.08	WT	0.91	8.2×10^{-8}	
	KO (FBA)	-0.064	6.0×10^{-4}	3.3×10^{-3}
	KO (MOMA)	0.56	7.4×10^{-3}	
C-0.4	WT	0.97	8.1×10^{-12}	
	KO (FBA)	0.77	8.1×10^{-5}	2.5×10^{-3}
	KO (MOMA)	0.94	2.6×10^{-9}

Conclusions

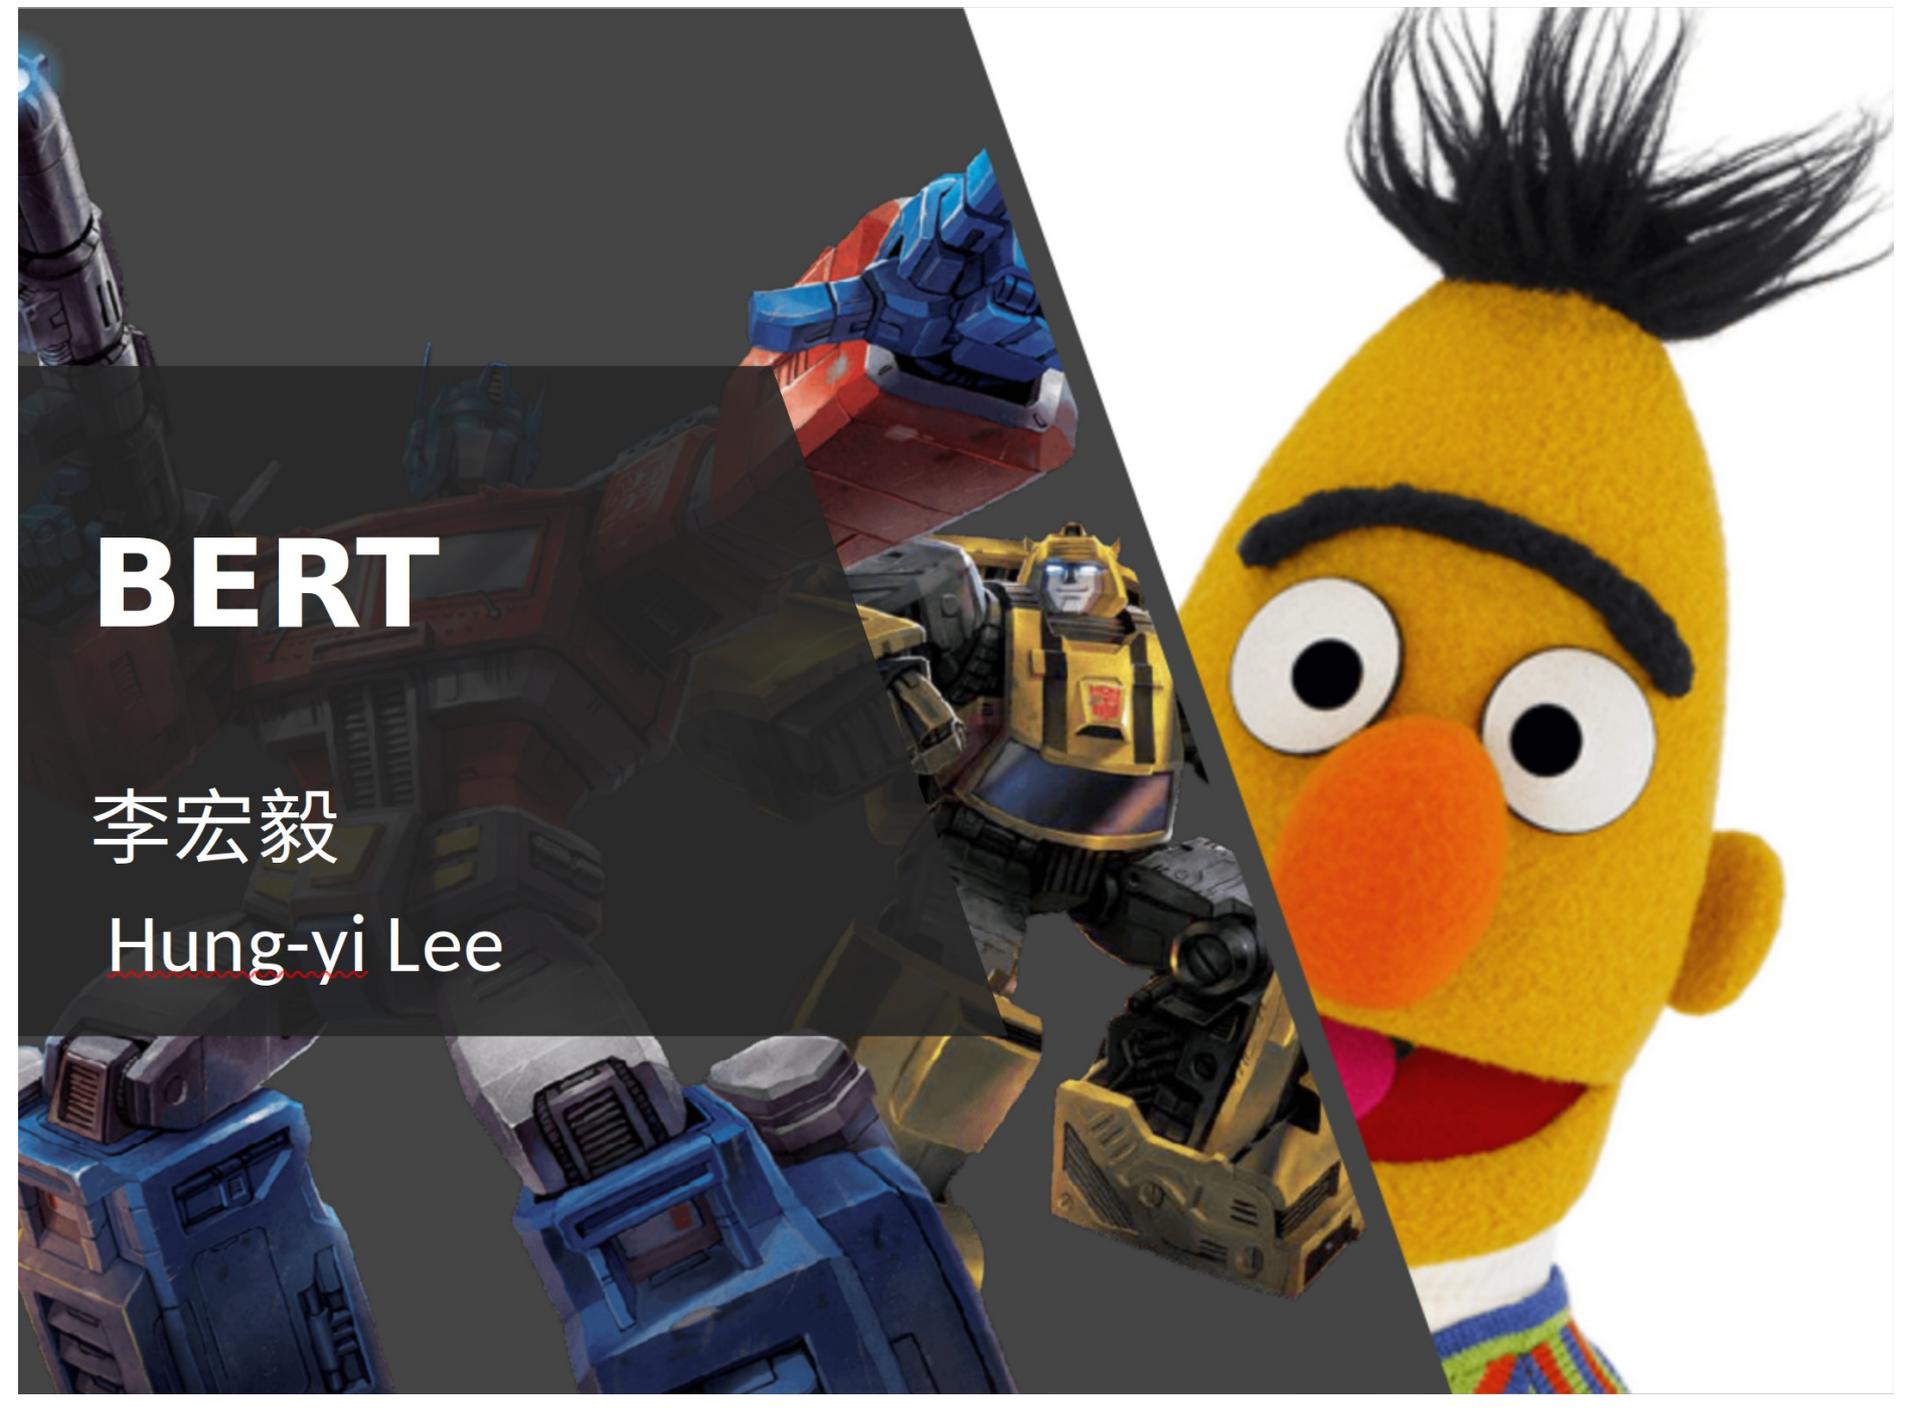

selection pressure results in optimal performance through evolutionary process.

This optimal performance can be predicted using *in-silico* modeling.

Unicellular evolution can be thought in terms of an iterative optimization procedure whose objective function maximizes the organisms ability to survive and proliferate. If given enough time (iterations) a local maxima is struck....

Unidirectional vs. Bidirectional Models

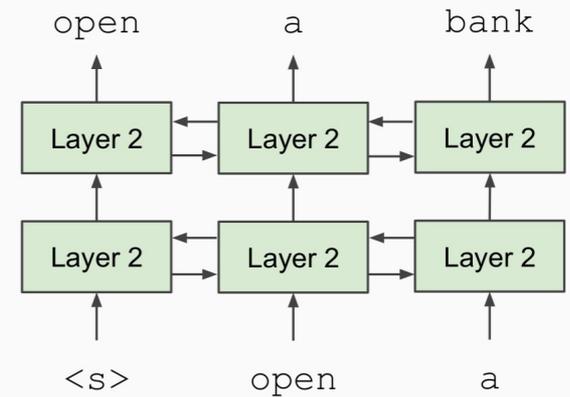

Unidirectional context

Build representation incrementally

Bidirectional context

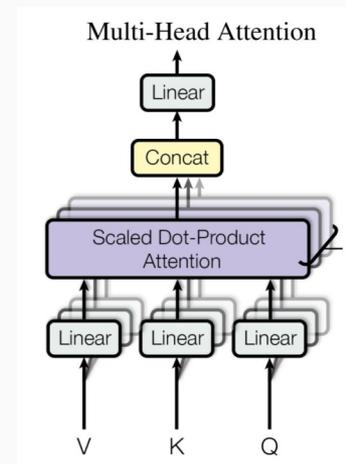

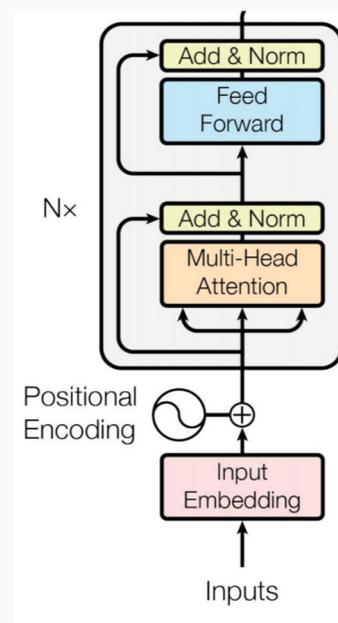

Words can “see themselves”

Model Architecture

Transformer encoder

- Multi-headed self attention
 - Models context
- Feed-forward layers
 - Computes non-linear hierarchical features
- Layer norm and residuals
 - Makes training deep networks healthy
- Positional embeddings
 - Allows model to learn relative positioning

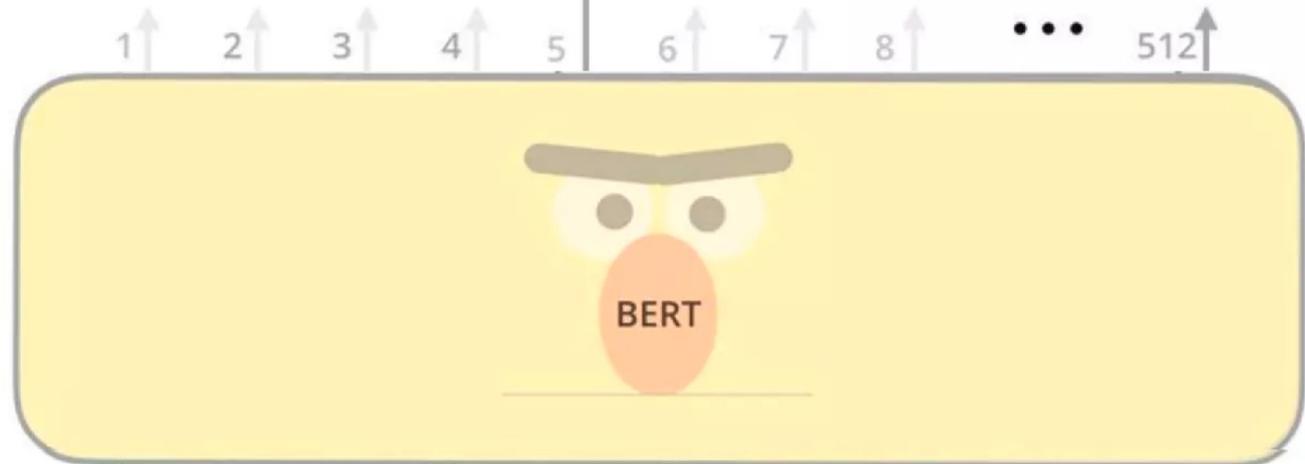

Use the output of the masked word's position to predict the masked word

Possible classes:

Randomly mask 15% of tokens

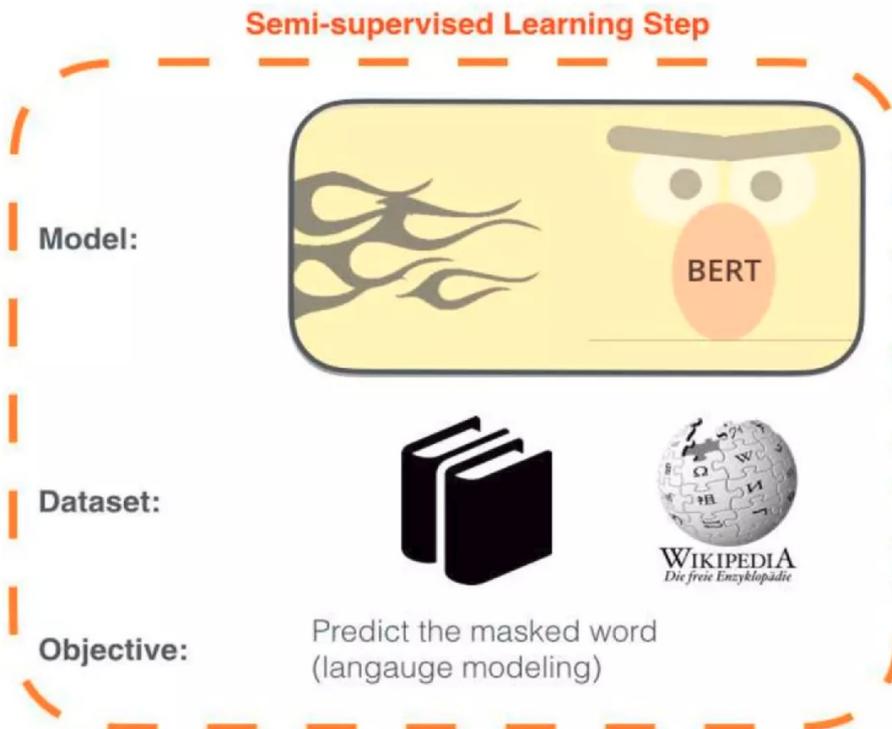

1 ↑ 2 ↑ 3 ↑ 4 ↑ 5 ↑ 6 ↑ 7 ↑ 8 ↑ ... 512 ↑
[CLS] Let's stick to [MASK] in this skit

Input

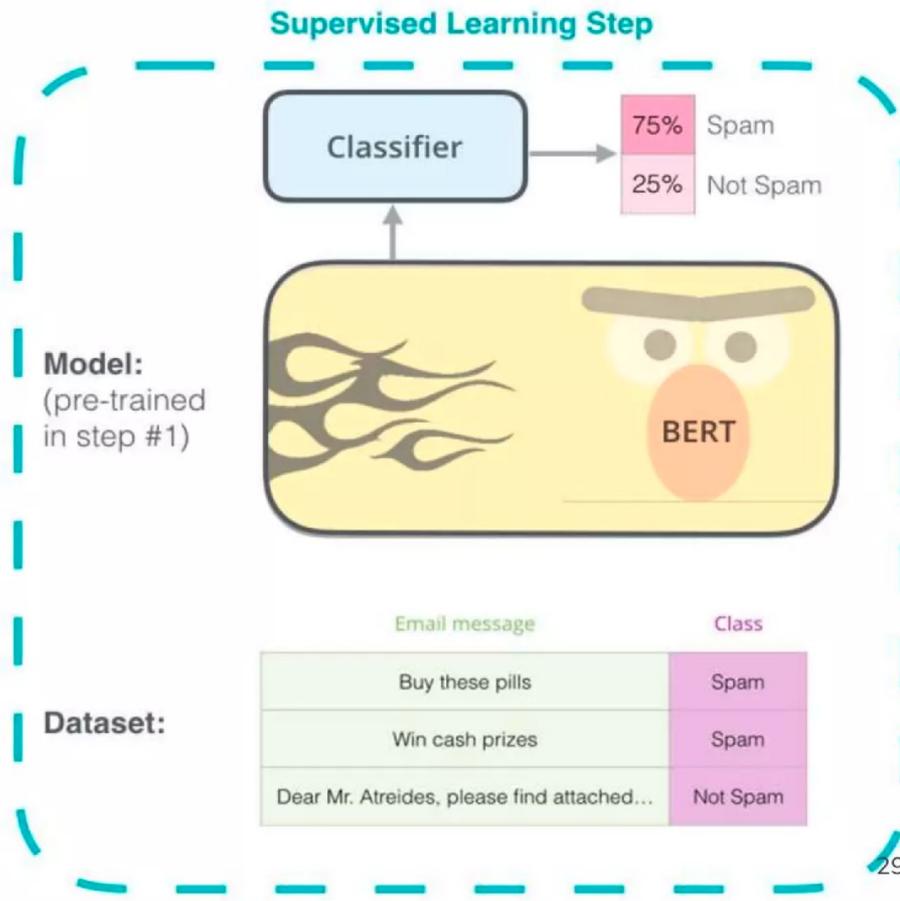

↑ ↑ ↑ ↑ ↑ ↑ ↑
[CLS] Let's stick to improvisation in this skit

1 - Semi-supervised training on large amounts of text (books, wikipedia..etc).

The model is trained on a certain task that enables it to grasp patterns in language. By the end of the training process, BERT has language-processing abilities capable of empowering many models we later need to build and train in a supervised way.

2 - Supervised training on a specific task with a labeled dataset.

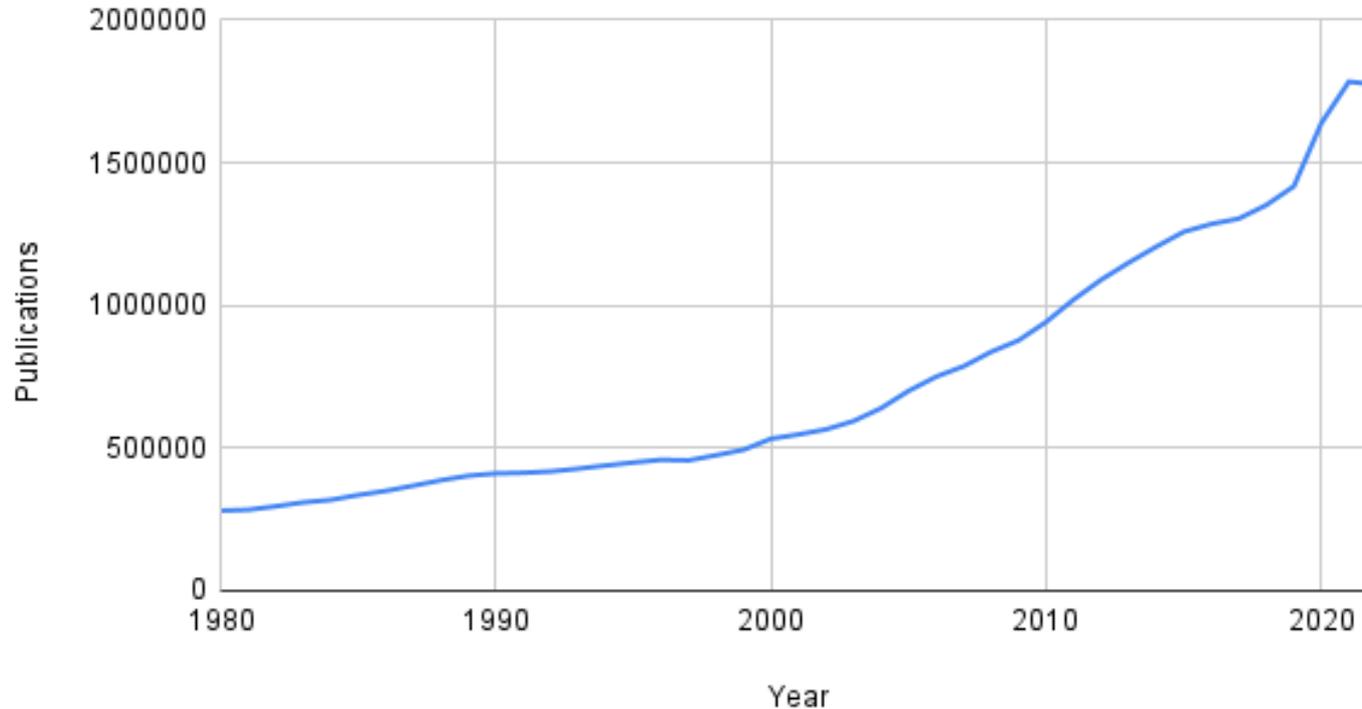

BERT was trained on Wikipedia (~2.5B words) and Google's BooksCorpus (~800M words).

These large informational datasets contributed to BERT's deep knowledge not only of the English language but also of our world

Motivation

Publications per Year

More than 2 articles published in biomedical journals every minute!

- Make sure this knowledge is used to the benefit of patients
- Need to make it accessible to biomedical experts
- Automated answering of questions based on semantics
- **Benchmarking** these systems can achieve a multiplying effect

BioASQ: Biomedical Semantic Indexing and Question Answering

- BioASQ initiated 2012 an annual challenge on **biomedical semantic indexing** and **question answering** (QA).

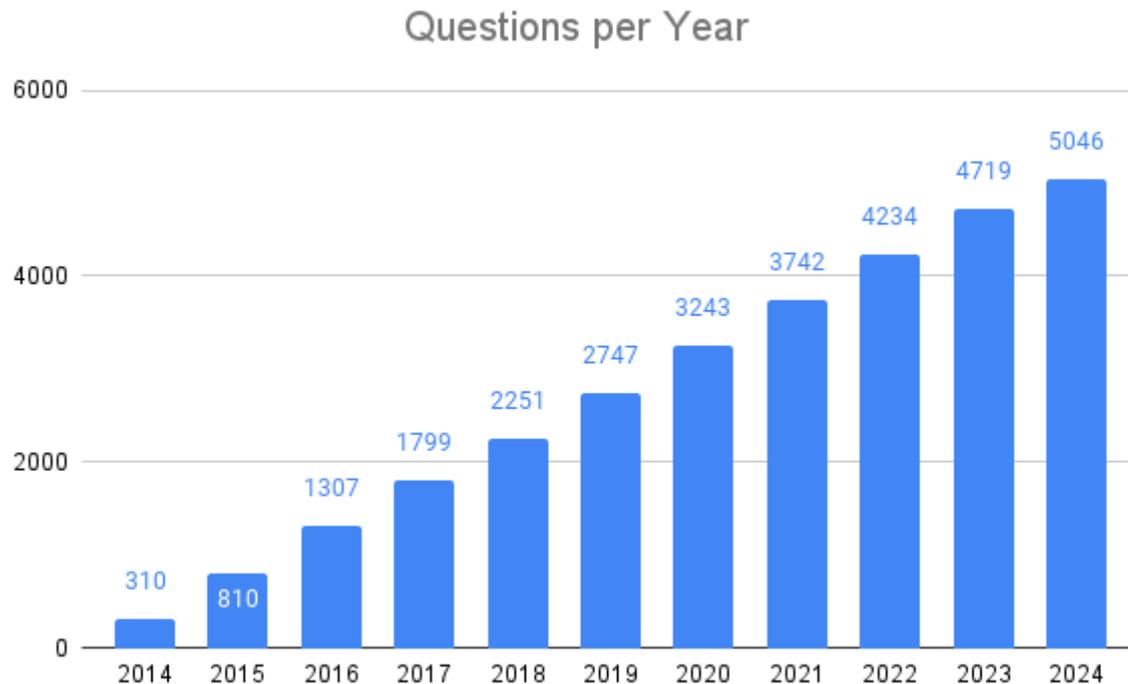

- Participants are required to compose **informative answers** to biomedical natural language questions.
- Includes tasks on question answering, summarization, entity detection, and more
- Funded by the EU and co-organized by several research institutions and companies
- Provides benchmark datasets, evaluation metrics, and prizes
- Attracts participants from various domains, such as NLP, ML, IR, and bioinformatics
- The best indexing system is now used by NIH to assign MeSHterms

BioASQ Dataset

The development dataset consists of biomedical questions in English, along with their gold concepts, articles, snippets, RDF triples, "exact" answers, and "ideal" answers in JSON format

Question-Answer pairs example

Question Answering models can retrieve the answer to a question from a given text, which is useful for searching for an answer in a document.

Question

Can losartan reduce brain atrophy in Alzheimer's disease?

Context

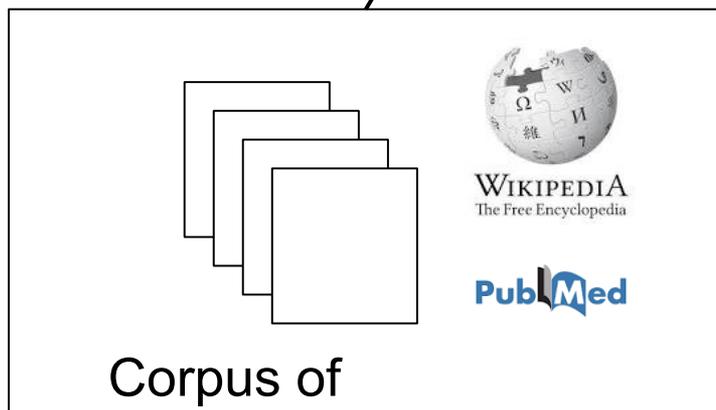

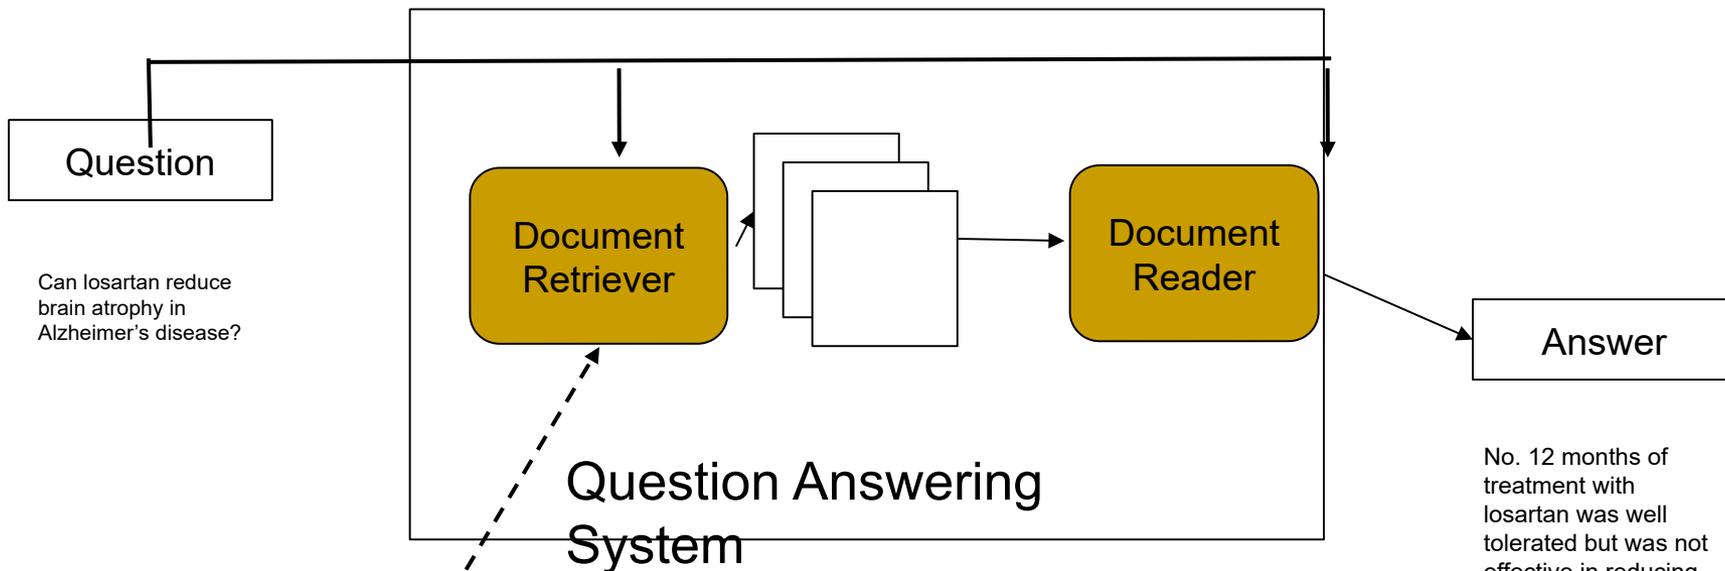

12 months of treatment with losartan was well tolerated but was not effective in reducing the rate of brain atrophy in individuals with clinically diagnosed mild-to-moderate Alzheimer's disease. [PMID: 34687634]

Answer

No

General Question Answering System

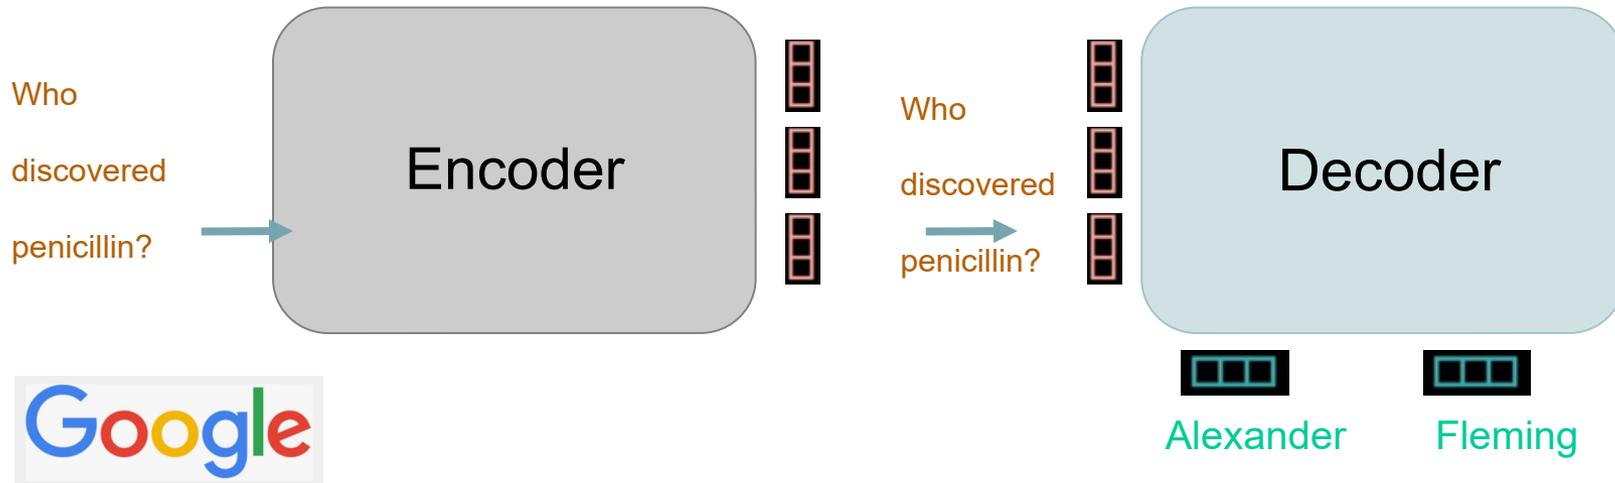

Retriever returns the top N documents most relevant to the question

Each candidate document is fed to the reader

Reader returns the highest rated content

Using Transformers

- groundbreaking algorithm pushing the state of the art in many areas
- used in many applications like machine language translation, conversational chatbots, better search engines, image annotation and **is the key algorithm for Alphafold2**

Abstract

The dominant sequence transduction models are based on complex recurrent or convolutional neural networks that include an encoder and a decoder. The best performing models also connect the encoder and decoder through an attention mechanism. We propose a new simple network architecture, the Transformer, based solely on attention mechanisms, dispensing with recurrence and convolutions entirely. Experiments on two machine translation tasks show these models to be superior in quality while being more parallelizable and requiring significantly less time to train. Our model achieves 28.4 BLEU on the WMT 2014 English-to-German translation task, improving over the existing best results, including ensembles, by over 2 BLEU. On the WMT 2014 English-to-French translation task, our model establishes a new single-model state-of-the-art BLEU score of 41.8 after training for 3.5 days on eight GPUs, a small fraction of the training costs of the best models from the literature. We show that the Transformer generalizes well to other tasks by applying it successfully to English constituency parsing both with large and limited training data.

*Equal contribution. Listing order is random. Jakob proposed replacing RNNs with self-attention and started the effort to evaluate this idea. Ashish, with Iliia, designed and implemented the first Transformer models and has been crucially involved in every aspect of this work. Noam proposed scaled dot-product attention, multi-head attention and the parameter-free position representation and became the other person involved in nearly every detail. Niki designed, implemented, tuned and evaluated countless model variants in our original codebase and tensor2tensor. Llion also experimented with novel model variants, was responsible for our initial codebase, and efficient inference and visualizations. Lukasz and Aidan spent countless long days designing various parts of and implementing tensor2tensor, replacing our earlier codebase, greatly improving results and massively accelerating our research.

31st Conference on Neural Information Processing Systems (NIPS 2017), Long Beach, CA, USA.

Attention mechanism can detect all relations in input sequences

Transformer models

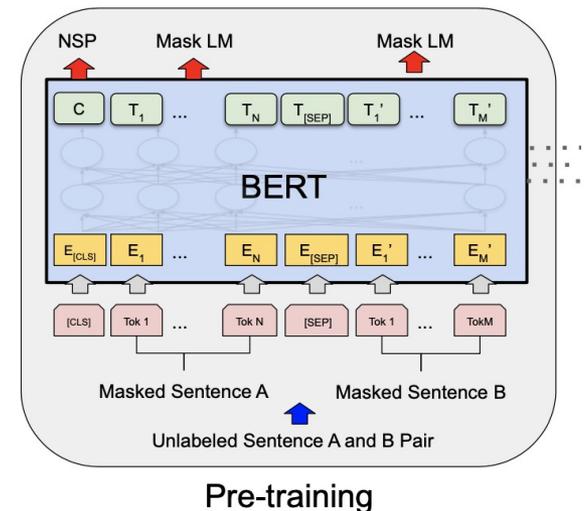

1. BERT

Bidirectional **E**ncoder **R**epresentations from **T**ransformers, 2018

BERT was trained on Wikipedia (~2.5B words) and Google's BooksCorpus (~800M words).

These large informational datasets contributed to BERT's deep knowledge not only of the English language but also of our world

- Masked Language Model
- Next Sentence Prediction
- Transfer learning

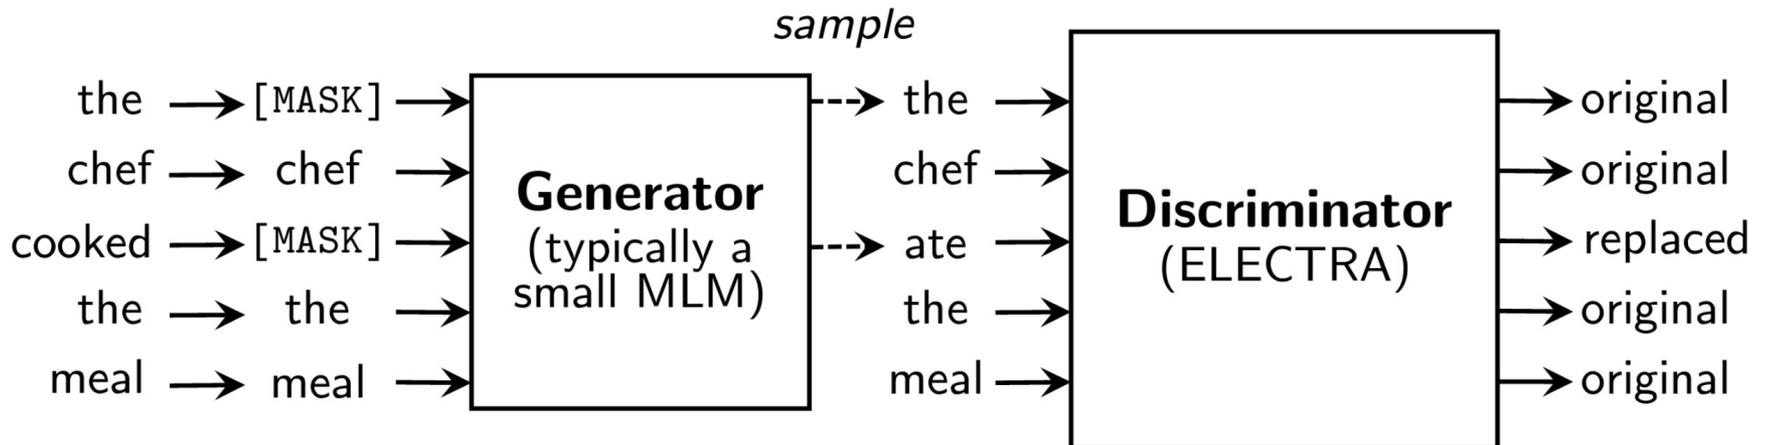

=> Finetune to final task

1. ELECTRA

Efficiently Learning an Encoder that Classifies Token Replacements Accurately
(K. Clark et al. 2020)

2. ALBERT

(Z. Lan et al. 2020)

- Factorized embedding parameterization
 - Cross-layer parameter sharing
 - Inter-sentence coherence loss / Sentence order prediction (SOP)
- speed
- performance

1. + 2. = **ELECTR-A-LBERT = ELECTROLBERT**

Question-Answer pairs in real abstracts

Coherence detected by sentence order prediction (SOP) facilitates answer identification. The topic-shift detection obtained with next sentence prediction (NSP) is less specific.

PMID	Question Answer
34884907	Neurogenic Inflammation in the Context of Endometriosis-What Do We Know? Endometriosis (EM) is an estrogen-dependent disease characterized by the presence of epithelial, stromal, and smooth muscle cells outside the uterine cavity.
34894155	The question to ask is, is this prescribed load regimen congruent with Wolff's law, and does it provide an adequate mechanical stimulus to maintain the functional health of periodontal complex? This question was answered by studying the effects of mice chewing on soft food (SF) and hard food (HF) while undergoing experimental tooth movement (ETM).
34893939	Will Artificial Intelligence (AI) re-humanize or de-humanize medicine? As AI becomes pervasive in clinical medicine, we argue that the ethical framework that sustains a responsible implementation of such technologies should be reconsidered.

Coherent scientific text has a semantic flow, each sentence builds upon the previous

ELECTROLBERT Architecture

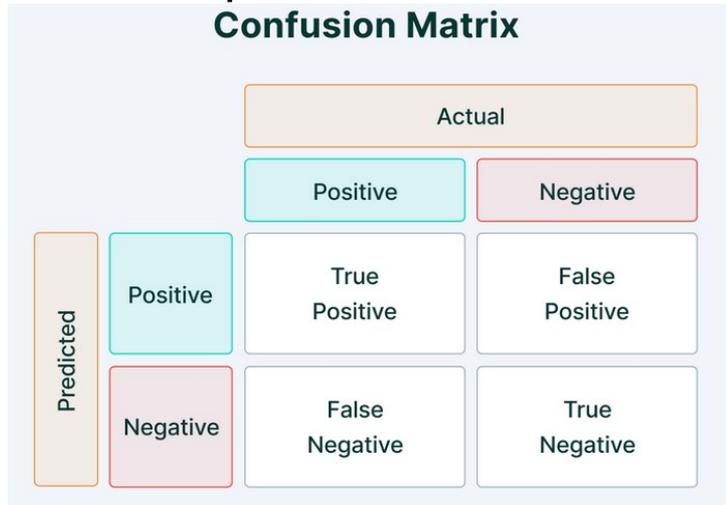

Phase 1: Retrieval

Phase 2: Ranking

Evaluation: Mean Average Precision (MAP)

Mean Average Precision (mAP) is the current benchmark metric used by the computer vision research community to evaluate the robustness of

- Calculate the confusion matrix—TP, FP, TN, FN.
- Calculate the precision and recall metrics.

$$AP = \frac{\sum_{r=1}^{|L|} P(r) \cdot rel(r)}{|L_R|} \quad \text{MAP} = \frac{1}{n} \cdot \sum_{i=1}^n AP_i$$

- Measure the average pre

ELECTROLBERT performance in BioASQ10, 2022

Generative Adversarial Networks (GANs)

GANBERT

Why to use GANBERT?

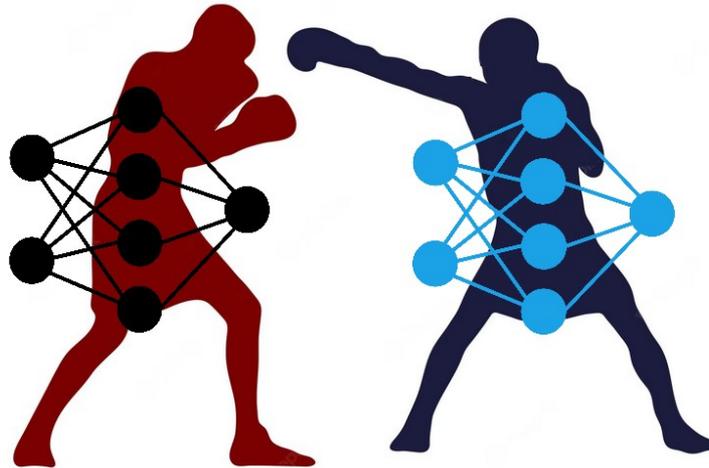

- In the era of information overload, answering questions accurately is crucial.
- Obtaining high-quality annotated data is expensive
- Fine-tuning of pretrained Large Language Models (LLM) helps, but risks overfitting
- Semi-supervised technique enhances generalization capabilities using extensive unlabeled text data, expanding LLM scope to handle alternative semantic formulations

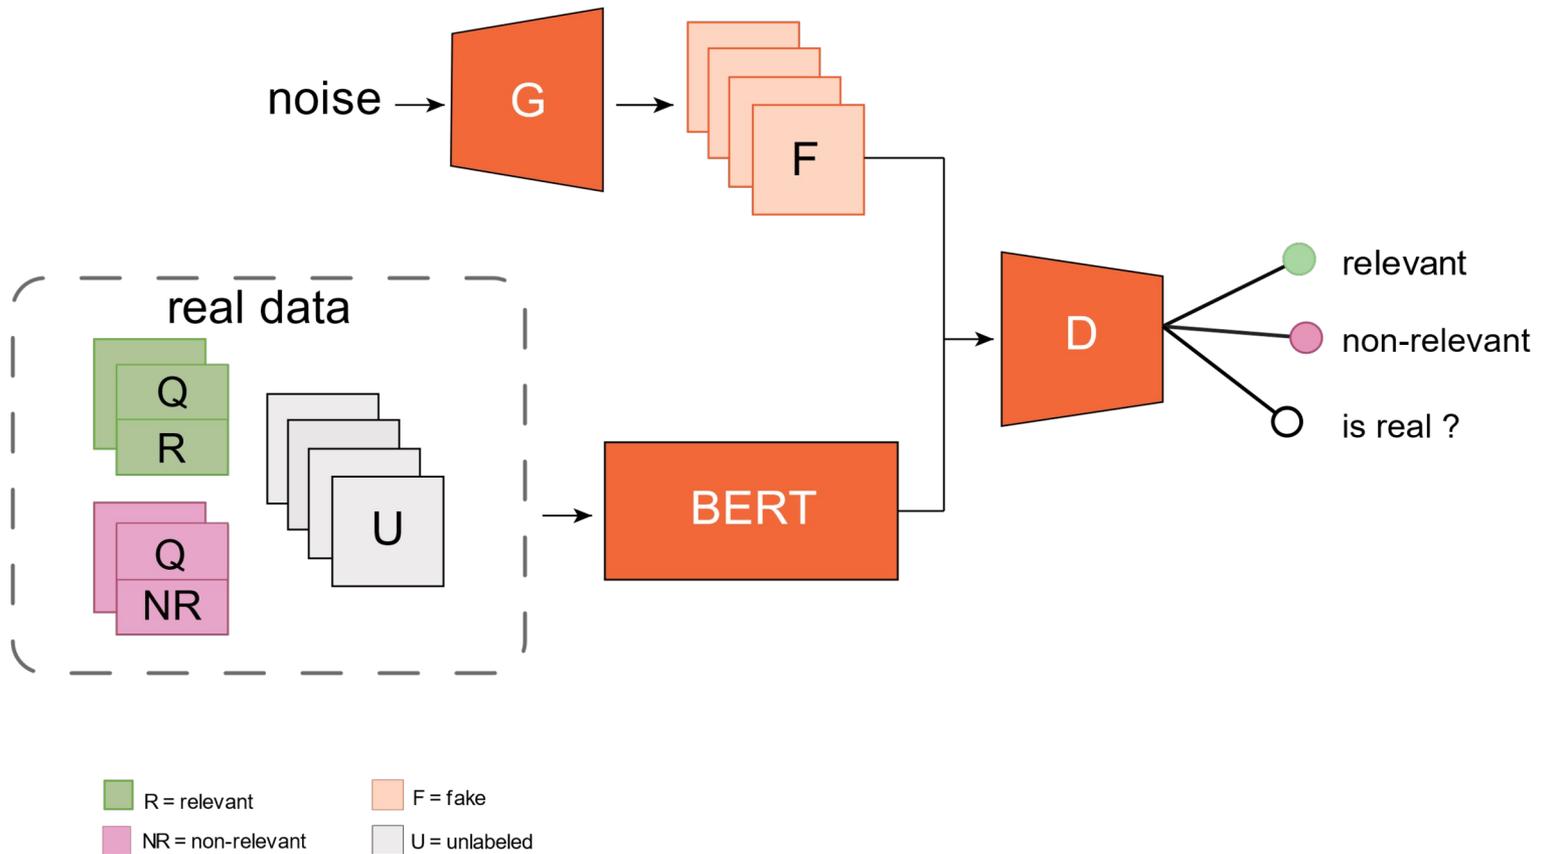

GANs

How does it work?

- GANBERT extends BERT by incorporating unlabeled data within a Generative Adversarial Network (GAN) framework
- Works by pitting two neural networks against each other
 - **generator (G)** is trained to produce internal BERT representations resembling the distribution of unlabeled data
 - **discriminator (D)** learns to distinguish between generator samples and real instar

COURSE MATERIALS

[Single-cell RNA-seq and network analysis using Galaxy and Cytoscape](#)

These materials include those from the course Single-cell RNA-seq & network analysis using Galaxy and Cytoscape, which ran in April 2021. The materials utilise Galaxy pipelines, an...

RECORDED WEBINAR

[Life cell by cell: Introduction to Single Cell Expression Atlas](#)

Explore gene expression profiles across various species and conditions at single cell resolution. Single Cell Expression Atlas (SCEA) is an open resource committed to making the information from...

COURSE MATERIALS

[Single-cell RNA-seq analysis using Galaxy](#)

The 'Single-cell RNA-seq analysis using Galaxy' course, which focused on the droplet-based scRNA-seq analysis pipelines from raw reads to trajectories, for mammalian and plant genomes, ran in March...

RECORDED WEBINAR

[Single cell RNA-seq analysis using a Galaxy interface](#)

In this webinar, we will look at a Galaxy interface for single cell analysis. Specifically, we will run Scanpy (which would otherwise require Python programming skills) to analyse a Drop-seq dataset...

COURSE MATERIALS

[Single-cell RNA-seq analysis using R](#)

This set of materials includes those from the 2022 course Single-Cell RNA-seq Analysis using R; it covers the analysis of scRNA-seq data using R and command line tools. Lectures and practical...

RECORDED WEBINAR

[Identifying tumor cells at the single cell level through machine learning](#)

Tumours are highly complex tissues composed of cancerous cells, surrounded by a heterogeneous cellular microenvironment. A tumor's response to treatments is governed by an interaction of the cancer...

The Biostar Handbook: 2nd Edition

Welcome to the Biostar Handbook

Last updated on **December 13, 2022**, ISBN: **978-0-578-80435-4**

The Biostar Handbook introduces readers to bioinformatics, the scientific discipline at the intersection of biology, computer science, and statistical data analytics dedicated to the digital processing of genomic information.

The Biostar Handbook has been developed, improved and refined over more than a half decade in a research university setting while used in an accredited Ph.D. level training program. The contents of this book have provided the analytical foundation to thousands of students, many of whom have become full-time bioinformaticians and work at the most innovative companies in the world.

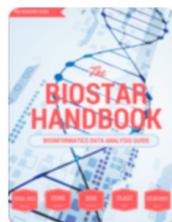

The Biostar Handbook Collection

The Biostar Handbook is being reworked into separate, more manageable volumes of study.

- [The Biostar Handbook](#) - An introduction to Bioinformatics as a scientific field.
- [The Art of Bioinformatics Scripting](#) - Learn advanced Unix and Bash scripting skills.
- [RNA-Seq by Example](#) - Master RNA-Seq data analysis.
- [Corona Virus Genome Analysis](#) - Advanced topics devoted to the study of the Corona Virus.
- [Biostar Workflows](#) - Create automated bioinformatics workflows

Access to new books and new content is included with your subscription!
