The two notions are the two sides of a single dubious coin.

Frege's example of 'EveningStar' and 'MorningStar' stands in exactly the same need of clarification as does the notion of truth. Kant's cleavage between analytic and synthetic truths was foreshadowed in Hume's distinction between relations of ideas and matters of fact, and in Leibniz's distinction between truths of reason and truths of fact. Leibniz spoke of the ideas which could not possibly be false. In the same vein we hear analytic statements defined as statements whose denials are self-contradictory. But this definition has small explanatory value; for the notion of self-contradictoriness, in the quite broad sense needed for this definition of analyticity stands in exactly the same need of clarification as does the notion of analyticity itself.

The two notions are the two sides of a single dubious coin.

Modern empiricism has been conditioned in large part by two dogmas. One is a belief in some fundamental cleavage between truths which are analytic; or grounded in meanings independently of matters of fact and truths which are synthetic, or grounded in fact. The other dogma is reductionism, the belief that each meaningful statement is equivalent to some logical construct upon terms which refer to immediate experience. Both dogmas, I shall argue, are ill founded. One effect of abandoning them is, as we shall see, a blurring of the supposed boundary between speculative metaphysics and natural science. Another effect is a shift toward pragmatism.

1. BACKGROUND FOR ANALYTICITY

Kant's cleavage between analytic and synthetic truths was foreshadowed in Hume's distinction between relations of ideas and matters of fact, and in Leibniz's distinction between truths of reason and truths of fact. Leibniz spoke of the ideas which could not possibly be false. In the same vein we hear analytic statements defined as statements whose denials are self-contradictory. But this definition has small explanatory value; for the notion of self-contradictoriness, in the quite broad sense needed for this definition of analyticity stands in exactly the same need of clarification as does the notion of analyticity itself. The two notions are the two sides of a single dubious coin.

Kant conceived of an analytic statement as one that attributes to its subject no more than is already conceptually contained in the subject. This formulation has two shortcomings: it limits itself to statements of subject-predicate form, and it appeals to a notion of containment which is left at a metaphorical level. But Kant's intent, evident more from the use he makes of the notion of analyticity than from his definition of it, can be restated thus: a statement is analytic when it is true by virtue of meanings and independently of fact. Pursuing this line, let us examine the concept of meaning which is presupposed.

---

---

With general terms, or predicates, the situation is somewhat different but parallel. Whereas a singular term purports to name an entity, abstract or concrete, a general term does not; but a general term is true of an entity, or of each of many, or of none. The class of all entities of which a general term is true is called the extension of the term. Now paralleling the contrast between the meaning of a singular term and the entity named, we must distinguish equally between the
meaning of a general term and its extension. The general terms 'creature with a heart' and 'creature with a kidney,' e.g., are perhaps alike in extension but unlike in meaning.

Confusion of meaning with extension in the case of general terms is less common than confusion of meaning with naming in the case of singular terms. It is indeed a commonplace in philosophy to oppose intention (or meaning) to extension or, in a variant, to connotation to denotation.

The Aristotelian notion of essence was the forerunner, no doubt, of the modern notion of intension or meaning. For Aristotle it was essential in men to be rational, accidental to be two-legged. But there is an important difference between this attitude and the doctrine of meaning. From the latter point of view it may indeed be conceded (if only for the sake of argument) that rationality is involved in the meaning of the word 'man' while two-leggedness is not; but two-leggedness may at the same time be viewed as involved in the meaning of 'biped' while rationality is not. Thus from the point of view of the doctrine of meaning it makes no sense to say of the actual individual, who is at once a man and a biped, that his rationality is essential and his two-leggedness accidental, or vice versa. Things had essences for Aristotle but only linguistic forms have meanings. Meaning is what essence becomes when it is divorced from the object of reference and wedded to the word.

For the theory of meaning the most conspicuous question is as to the nature of its objects: what sort of things are meanings?

They are evidently intended to be ideas, somehow -- mental ideas for some semanticists, Platonic ideas for others. Objects of either sort are so elusive, not to say debatable, that there seems little hope of erecting a fruitful science about them. It is not even clear, granted meanings, when we have two and when we have one; it is not clear when linguistic forms should be regarded as synonymous or alike in meaning and when they should not. If a standard of synonymy should be arrived at, we may reasonably expect that the appeal to meanings as entities will not have played a very useful part in the enterprise.

A felt need for meant entities may derive from an earlier failure to appreciate that meaning and reference are distinct. Once the theory of meaning is sharply separated from the theory of reference, it is a short step to recognizing as the business of the theory of meanings simply the synonymy of linguistic forms and the analyticity of statements meanings themselves as obscure intermediaries, may well be abandoned.

Statements which are analytic by general philosophical acclamation are not, indeed, far to seek. They fall into two classes. Those of the first class, which may be called logically true, are typified by:

(1) No unmarried man is married.

The relevant feature of this example is that it is not merely true as it stands, but remains true under any and all reinterpretations of 'man' and 'married.' If we suppose a prior inventory of logical particles, comprising 'no,' 'un-,' 'if,' 'then,' 'and,' etc., then in general a logical truth is a statement which is true and remains true under all reinterpretations of its component other than the logical particles.

But there is also a second class of analytic statements typified by:

(2) No bachelor is married.

The characteristic of such a statement is that it can be turned into a logical truth by putting synonyms for synonyms: thus (2) can be turned into (1) by putting 'unmarried man' for its synonym 'bachelor.' We still lack a proper characterization of this second class of analytic statements and therewith of analyticity generally, inasmuch as we have had in the above description to lean on a notion of 'synonymy' which is no less in need of clarification than analyticity itself.

In recent years Carnap has tended to explain analyticity by appeal to what he calls state-descriptions. A state-description is any exhaustive assignment of truth values to the atomic, or noncompound, statements of the language. All other statements of the language are, Carnap assumes, built up of their component clauses by means of the familiar logical devices, in such a way that the truth value of any complex statement is fixed for each state-description by specifiable logical laws. A statement is then explained as analytic when it comes out true under every state-description. This account is an adaptation of Leibniz's "true in all possible worlds." But note that this version of analyticity serves its purpose only if the atomic statements of the language, unlike 'John is a bachelor' and 'John is married,' mutuality independent. Otherwisethere would be a state-description which assigned truth to 'John is a bachelor' and falsity to 'John is married,' and consequently 'All bachelors are married' would turn out synthetic rather than analytic under the proposed criterion. Thus the criterion of analyticity in terms of state-description serves only for languages devoid of extralogical
synonym pairs such as 'bachelor' and 'unmarriedman': synonym pairs of the type which give rise to the "second class" of analytic statements. The criterion in terms of state-description is a reconstruction at best of logical truth.

I do not mean to suggest that Carnap is under any illusions on this point. His simplified model language with its state-description is aimed primarily not at the general problem of analyticity but at another purpose, the clarification of probability and induction. Our problem however, is analyticity and here the major difficulty lies not in the first class of analytic statements the logical truths, but rather in the second class, which depend on the notion of synonymy.

II. DEFINITION

There are those who find it soothing to say that the analytic statements of the second class reduce to those of the first class, the logical truths, by definition 'bachelor,' for example, is defined as 'unmarriedman.' But how do we find that 'bachelor' is defined as 'unmarriedman'? Who defined it thus, and when? Are we to appeal to the nearest dictionary, and accept the lexicographe's formulation as law? Clearly this would be to put the cart before the horse. The lexicographer is an empirical scientist, whose business is the recording of antecedent facts; and if he glosses 'bachelor' as 'unmarriedman' it is because of his belief that there is a relation of synonymy between these forms, implicit in general or preferred usage, prior to his own work. The notion of synonymy presupposed here has still to be clarified, presumable in terms relating to linguistic behavior. Certainly the "definition" which is the lexicographer's report of an observed synonymy cannot be taken as the ground of the synonymy.

Definition is not, indeed, an activity exclusively of philologists. Philosophers and scientists frequently have occasions to "define" a recondite term by paraphrasing it into terms of a more familiar vocabulary. But ordinarily such a definition, like the philologists', is pure lexicography, affirming a relationship of synonymy antecedent to the exposition in hand.

Just what it means to affirm synonymy just what the interconnections may be which are necessary and sufficient in order that two linguistic forms be properly describable as synonyms is far from clear; but, whatever these interconnections be, ordinarily they are grounded in usage. Definitions reporting selected instances of synonymy come then as reports upon usage.

There is also, however, a variant type of definitional activity which does not limit itself to the reporting of pre-existing synonymies. I have in mind what Carnap calls explication--an activity to which philosophers are given, and scientists also in their more philosophical moments. In explication the purpose is not merely to paraphrase the definiendum into an outright synonym but actually to improve upon the definiendum by refining or supplementing its meaning. But even explication, though not merely reporting a pre-existing synonymy between definiendum and definiens does rest nevertheless on other pre-existing synonymies. The matter may be viewed as follows. Any word worth explicating has some contexts within which, as wholes, are clear and precise enough to be useful, and the purpose of explication is to preserve the usage of these favored contexts while sharpening the usage of other contexts. In order that a given definition be suitable for purposes of explication therefore, what is required is not that the definiendum in its antecedent usage be synonymous with the definiens but just that each of these favored contexts of the definiendum taken as a whole in its antecedent usage be synonymous with the corresponding context of the definiens.

Two alternative definitions may be equally appropriate for the purposes of a given task of explication and yet not be synonymous with each other; for they may serve interchangeably within the favored contexts but diverge elsewhere. By cleaving to one of these definitions rather than the other, a definition of explicative kind generates fiat, a relationship of synonymy between definiendum and definiens which did not hold before. But such a definition still owes its explicative function as seen, to pre-existing synonymies.

Therfore, however, remain still an extreme sort of definition which does not hark back to prior synonymies at all; namely, the explicitly conventional introduction of novel notations for purposes of sheer abbreviation. Here the definiendum becomes synonymous with the definiens simply because it has been created expressly for the purpose of being synonymous with the definiens. Here we have a transparent case of synonymy created by definition where all species of synonymy were as intelligible. For the rest, definition rests on synonymy rather than on explaining.

The word "definition" has come to have a dangerously reassuring sound, due no doubt to its frequent occurrence in discourse. But it is practical another way: it greatly simplifies theoretical discourse about the language through minimizing the terms and the forms of construction wherein the language consists.

Both sorts of economy, though prima facie incompatible are valuable in their separate ways. The custom has consequently arisen of combining both sorts of economy by forging in effect two languages the one a part of the other. The inclusive language though redundant in grammar and vocabulary, is economical in message lengths, while the part, called primitivenotation, is economical in grammar and vocabulary. Whole and part are correlated by rules of translation whereby each idiom not in primitivenotation is equated to some complex built up of primitivenotation. These rules of
translation are the so-called definitions which appear in formalized systems. They are best viewed not as adjuncts to one language but as correlations between two languages the one a part of the other.

But these correlations are not arbitrary. They are supposed to show how the primitive notations can accomplish all purposes save brevity and convenience of the redundant language. Hence the definiendum and its definiens may be expected in each case, to be related in one or another of the three ways lately noted. The definiens may be a faithful paraphrase of the definiendum into the narrower notation, preserving direct synonymy\(^{5b}\) as of antecedent usage, or the definiens may, in the spirit of explanation, improve upon the antecedent usage of the definiendum or finally, the definiendum may be a newly created notation, newly endowed with meaning here and now.

In formal and informal work alike, thus, we find that definition—except in the extreme case of the explicitly conventional introduction of new notation—hinges on prior relationships of synonymy. Recognizing then that the notation of definition does not hold the key to synonymy and analyticity let us look further into synonymy and say no more of definition.

### III. INTERCHANGEABILITY

A natural suggestion deserving close examination is that the synonymy of two linguistic forms consists simply in their interchangeability in all contexts without change of truth value; interchangeability in Leibniz's phrase, salva veritate\(^{5b}\). Note that synonymy so conceived need not even be free from vagueness, as long as the vaguenesses match.

But it is not quite true that the synonyms 'bachelor' and 'unmarried man' are everywhere interchangeablesalva veritate. Truths which become false under substitution of 'unmarried man' for 'bachelor' are easily constructed with help of 'bachelor of arts' or 'bachelor's buttons.' Also with help of quotation, thus:

'Bachelor has less than ten letters.' But it is not quite true that the synonyms 'bachelor' and 'unmarried man' are everywhere interchangeable. Now let us be clear that we are not concerned here with synonymy in the sense of complete identity in psychological associations or poetic quality; indeed no two expressions are synonymous in such a sense. We are concerned only with what may be called cognitive synonymy. Just what this is cannot be said without successfully finishing the present study; but we know something about it from the need which arose for it in connection with analyticity in Section 1. The sort of synonymy needed there was merely such that any analytic statement could be turned into a logical truth by putting synonyms for synonyms. Turning the tables and assuming analyticity indeed, we could explain cognitive synonymy of terms as follows (keeping to the familiar example): to say that 'bachelor' and 'unmarried man' are cognitively synonymous is to say no more nor less than that the statement:

(3) All and only bachelors are unmarried men

is analytic.\(^{4a}\)

What we need is an account of cognitive synonymy not presupposing analyticity— if we are to explain analyticity conversely with help of cognitive synonymy as undertaken in Section 1. And indeed such an independent account of cognitive synonymy is at present up for consideration namely, interchangeabilitysalva veritate everywhere except within words. The question before us, to resume the thread at last, is whether such interchangeability is a sufficient condition for cognitive synonymy. We can quickly assure ourselves that it is, by examples of the following sort. The statement

(4) Necessarily all and only bachelors are bachelors

is evidently true, even supposing necessarily so narrowly construed as to be truly applicable only to analytic statements. Then, if 'bachelor' and 'unmarried man' are interchangeablesalva veritate, the result

(5) Necessarily all and only bachelors are unmarried men

of putting 'unmarried man' for an occurrence of 'bachelor' in (4) must, like (4), be true. But to say that (5) is true is to say that (3) is analytic, and hence that 'bachelor' and 'unmarried man' are cognitively synonymous.

Let us see what is the case. But the above argument gives us two viewpoints: the condition of interchangeabilitysalva veritate varies in its force with variations in the richness of the language at hand. The above argument supposes we are working with a language rich enough to contain the adverb 'necessarily' this adverb being so construed as to yield truth when and only when applied to an analytic statement. But can we condone a language which

---

4a, 7b: Parenthetical Notes

Seite 4 Two Dogmas of Empiricism
contain such an adverb? Does the adverb really make sense? To suppose that it does is to suppose that we have already made satisfactory sense of 'analytic.' Then what are we so hard at work on right now?

Our argument is not flatly circular, but something like it. It has the form, figuratively speaking, of a closed curve in space.

Interchangeability *salva veritate* is meaningless until relativized to a language whose extent is specified in relevant respects. Suppose now we consider a language containing just the following materials: There is an indefinitely large stock of one- and many-place predicates

<table>
<thead>
<tr>
<th>(1951)</th>
<th>(1961)</th>
</tr>
</thead>
<tbody>
<tr>
<td>There is an indefinitely large stock of one- and many-place predicates</td>
<td>There is an indefinitely large stock of one-place predicates (for example, 'F' where 'Fx' means that x is a man) and many-place predicates (for example, 'G' where 'Gxy' means that x loves y).</td>
</tr>
</tbody>
</table>

mostly having to do with extralogical subject matter. The rest of the language is logical. The atomic sentences consist of a predicate followed by one or more variables 'x', 'y', etc.; and the complex sentences are built up of atomic ones by truth functions ('not', 'and', 'or', etc.) and quantification. In effect such a language enjoys the benefits also of descriptions and class names and indeed singular terms generally these being contextually definable in known ways.

<table>
<thead>
<tr>
<th>(1951)</th>
<th>(1961)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Such a language can be adequate to classical mathematics and indeed to scientific discourse generally except insofar as the latter involves debatable devices such as modal adverbs and contrary-to-fact conditionals</td>
<td>Such a language can be adequate to classical mathematics and indeed to scientific discourse generally except insofar as the latter involves debatable devices such as contrary-to-fact conditionals or modal adverbs like 'necessarily.'</td>
</tr>
</tbody>
</table>

Now a language of this type is *extensional* in this sense: any two predicates which agree extensionally (i.e., are true of the same objects) are interchangeable *salva veritate*.

In an extensional language, therefore, interchangeability *salva veritate* is no assurance of cognitive synonymy of the desired type. That 'bachelor' and 'unmarried man' are interchangeable *salva veritate* in an extensional language assures us of no more than that (3) is true. There is no assurance here that the extensional agreement of 'bachelor' and 'unmarried man' rests on meaning rather than merely on accidental matters of fact, as does extensional agreement of 'creature with a heart' and 'creature with a kidney.'

For most purposes extensional agreement is the nearest approximation to synonymy we need care about. But the fact remains that extensional agreement falls far short of cognitive synonymy of the type required for explaining analyticity in the manner of Section I. The type of cognitive synonymy required there is such as to equate the synonymy of 'bachelor' and 'unmarried man' with the analyticity of (2), not merely with the truth of (3).

So we must recognize that interchangeability *salva veritate*, if construed in relation to an extensional language is not a sufficient condition of cognitive synonymy in the sense needed for deriving analyticity in the manner of Section I. If a language contains an intensional adverb 'necessarily' in the sense lately noted, or other particles to the same effect, then interchangeability *salva veritate* in such a language does afford a sufficient condition of cognitive synonymy, but such a language is intelligible only if the notion of analyticity is already clearly understood in advance.

The effort to explain cognitive synonymy first, for the sake of deriving analyticity from it afterwards in Section I, is perhaps the wrong approach. Instead we might try explaining analyticity somehow without appeal to cognitive synonymy. Afterward we could doubtless express cognitive synonymy from analyticity satisfactorily enough if desired. We have seen that cognitive synonymy of 'bachelor' and 'unmarried man' can be explained as analyticity of (3). The same explanation works for any pair of one-place predicates of course, and it can be extended in obvious fashion to many-place predicates. Other syntactical categories can also be accommodated in fairly parallel fashion. Singular terms may be said to be cognitively synonymous when the statement of identity formed by putting '=' between them is analytic. Statements may be said simply to be cognitively synonymous when the biconditional (the result of joining them by 'if and only if') is analytic. If we care to lump all categories into a single formulation at the expense of assuming again the notion of 'word' which was appealed to early in this section, we can describe any two linguistic forms as cognitively synonymous when the two forms are interchangeable apart from occurrences within "words") *salva* (no longer *veritate* but *analyticitate*. Certain technical questions arise, indeed, over cases of ambiguity or homonymy, let us not pause for them however, for we are already digressing. Let us rather turn our backs on the problem of synonymy and address ourselves anew to that of analyticity.

**IV. SEMANTICAL RULES**

Analyticity first seemed most naturally definable by appeal to a realm of meanings. On refinement the appeal to meanings gave way to an appeal to synonymy or definition. But definition turned out to be a will-o'-the-wisp, and synonymy turned out to be best understood only by dint of a prior appeal to analyticity itself. So we are back at the problem of analyticity.

http://www.ditext.com/quine/quine.html
I do not know whether the statement 'Everything green is extended' is analytic. Now does my indecision over this example really betray an incomplete understanding or an incomplete grasp of the "meanings" of 'green' and 'extended'? I think not. The trouble is not with 'green' or 'extended' but with 'analytic'.

It is often hinted that the difficulty in separating analytic statements from synthetic ones in ordinary language is due to the vagueness of ordinary language and that the distinction is clear when we have a precise artificial language with explicit "semantical rules." This, however, as I shall now attempt to show, is a confusion.

The notion of analyticity about which we are worrying is a purported relation between statements and languages; a statement S is said to be analytic for a language L, and the problem is to make sense of this relation generally for example, for variable S and L.' The point that I want to make is that the gravity of this problem is not perceptibly less for artificial language than for natural ones. The problem of making sense of the idiom 'S is analytic for L,' with variable S and L, retains its stubbornness even if we limit the range of the variable L to artificial languages. Let me now try to make this point evident.

For artificial languages and semantical rules we look naturally to the writings of Carnap. His semantical rules take various forms, and to make my point I shall have to distinguish certain of the forms. Let us suppose, to begin with, an artificial language L₀ whose semantical rules have the form explicitly of a specification by recursion or otherwise, of all the analytic statements of L₀. The rules tell us that such and such statements and only those are the analytic statements of L₀. Now here the difficulty is simply that the rules contain the word 'analytic,' which we do not understand! We understand what expressions the rules attribute analyticity to, but we do not understand what the rules attribute to those expressions. In short, before we can understand a rule which begins "A statement S is analytic for language L₀ if and only if . . . " we must understand the general relativeterm 'analytic for'; we must understand S is analytic for L where 'S' and 'L' are variables.

Alternatively we may, indeed, view the so-called rule as a conventional definition of a new simple symbol 'analytic-for-L₀,' which might better be written unentendently as 'K' so as not to seem to throw light on the interesting word "analytic." Obviously any number of classes K, M, N, etc., of statements of L₀ can be specified for various purposes or for no purpose, whatever it means to say that K, as against M, N, etc., is the class of the 'analytic' statements of L₀?

By saying what statements are analytic for L₀, we explain 'analytic-for-L₀,' but not 'analytic for.' We do not begin to explain the idiom 'S is analytic for L' with variable 'S' and 'L,' even though we be content to limit the range of 'L' to the realm of artificial languages.

Actually we do know enough about the intended significance of 'analytic' to know that analytic statements are supposed to be true. Let us then turn to a second form of semantical rule, which says not that such and such statements are analytic but simply that such and such statements are included among the truths. Such a rule is not subject to the criticism of containing the un-understood word 'analytic;' and we may grant for the sake of argument that there is no difficulty over the broader term 'true.' A semantical rule of this second type, a rule of truth, is not supposed to specify all the truths of the language it merely stipulates recursively or otherwise a certain multitude of statements which along with others unspecified are to count as true. Such a rule may be conceded to be quite clear. Derivatively afterward analyticity can be demarcated thus: a statement is analytic if it is (not merely true but) true according to the semantical rule.

Still there is really no progress. Instead of appealing to an unexplained word 'analytic,' we are now appealing to an unexplained phrase 'semantical rule.' Not every true statement which says that the statements of some class are true can count as a semantical rule -- otherwise all truths would be "analytic" in the sense of being true according to semantical rules. Semantical rules are distinguishable as being true only by the fact of appearing on a page under the heading 'Semantical Rules'; and this heading is itself then meaningless.

We can say indeed that a statement is analytic-for-L₀ if and only if it is true according to such and such specifically appendend "semantical rules" but then we find ourselves back at essentially the same case which was originally discussed 'S is analytic for-L₀ if and only if . . .' Once we seek to explain 'S is analytic for L' generally for variable L' (even allowing limitation of L to artificial languages), the explanation true according to the semantical rules of L is unavailing for the relativ term 'semantical rule of' is as much in need of clarification at least, as 'analytic for.'
It may be instructive to compare the notion of semantical rule with that of postulate. Relative to the given set of postulates it is easy to say that what a postulate is: it is a member of the set. Relative to a given set of semantical rules it is equally easy to say what a semantical rule is. But given simply a notation, mathematical or otherwise, and indeed as thoroughly understood a notation as you please in point of the translation or truth conditions of its statements who can say which of its true statements rank as postulates? Obviously the question is meaningless -- as meaningless as asking which points in Ohio are starting points. Any finite (or effectively specifiable infinite) selection of statements (preferably true ones, perhaps) is as much a set of postulates as any other. The word 'postulate' is significant only relative to an act of inquiry; we apply the word to a set of statements just in so far as we happen, for the year or the argument to be thinking of those statements which can be reached from them by some set of transformations to which we have seen fit to direct our attention. Now the notion of semantical rule is as sensible and meaningful as that of postulate, if conceived in a similarly relative spirit -- relative, this time, to one or another particular enterprise of schooling unconversant persons in sufficient conditions for truth of statements of some natural or artificial language. But from this point of view no one signalization of a subclass of the truths of L is intrinsically more a semantical rule than another, and, if 'analytic' means 'true by semantical rules', no one truth of L is analytic to the exclusion of another.

It might conceivably be protested that an artificial language L (unlike a natural one) is a language in the ordinary sense plus a set of explicit semantical rules -- the whole constituting, let us say, an ordered pair, and that the semantical rules of L then are specifiable simply as the second component of the pair L. But, by the same token and more simply, we might construe an artificial language L outright as an ordered pair whose second component is the class of its analytic statements and then the analytic statements of L become specifiable simply as the statements in the second component of L. Or better still, we might just stop tugging at our bootstraps altogether.

Not all the explanations of analyticity known to Carnap and his readers have been covered explicitly in the above considerations but the extension to other forms is not hard to see. Just one additional factor should be mentioned, which sometimes enters: sometimes the semantical rules are in effect rules of translation into ordinary language in which case the analytic statements of the artificial language are in effect recognized as such from the analyticity of their specified translations in ordinary language. Here certainly there can be no thought of an illumination of the problem of analyticity from the side of the artificial language.

From the point of view of the problem of analyticity the notion of an artificial language with semantical rules is a feu follet par excellence. Semantical rules determining the analytic statements of an artificial language are of interest only in so far as we already understand the notion of analyticity. They are of no help in gaining this understanding.

Appeal to hypothetical languages of an artificially simple kind could conceivably be useful in clarifying analyticity if the mental or behavioral cultural factors relevant to analyticity -- whatever they may be -- were somehow sketched into the simplified model. But a model which takes analyticity merely as an irreducible characteristic is unlikely to throw light on the problem of explicating analyticity.

It is obvious that truth in general depends on both language and extra-linguistic fact. The statement 'Brutus killed Caesar' would be false if the world had been different in certain ways, but it would also be false if the word 'killed' happened rather to have the sense of 'begat.' Hence the temptation to suppose in general that the truth of a statement is somehow analyzable into a linguistic component and a factual component. Given this supposition it next seems reasonable that in some statements the factual component should be null; and these are the analytic statements. But, for all its a priori reasonableness a boundary between analytic and synthetic statement simply has not been drawn. That there is such a distinction to be drawn at all is an unempirical dogma of empiricists; a metaphysical article of faith.

V. THE VERIFICATION THEORY AND REDUCTIONISM

In the course of these somber reflections we have taken a dim view first of the notion of meaning, then of the notion of cognitive synonymy, and finally of the notion of analyticity. But what, it may be asked, of the verification theory of meaning? This phrase has established itself so firmly as a catchword of empiricism that we should be very unscientific indeed not to look beneath it for a possible key to the problem of meaning and the associated problems.

http://www.ditext.com/quine/quine.html
The verification theory of meaning, which has been conspicuous in the literature from Peirce onward, is that the meaning of a statement is the method of empirically confirming or infirming it. An analytic statement is that limiting case which is confirmed no matter what.

As urged in Section 1, we can as well pass over the question of meanings as entities and move straight to sameness of meaning or synonymy. Then what the verification theory says is that statements are synonymous if and only if they are alike in point of method of empirical confirmation or infirmation.

This is an account of cognitive synonymy not of linguistic forms generally but of statements. However, from the concept of synonymy of statements we could derive the concept of synonymy for other linguistic forms, by consideration somewhat similar to those at the end of Section III. Assuming the notion of “word,” indeed, we could explain any two forms as synonymous when the putting of the one form for an occurrence of the other in any statement (apart from occurrences within “words”) yields a synonymous statement. Finally, given the concept of synonymy for linguistic forms generally we could define analyticity in terms of synonymy and logical truth as in Section I. For that matter, we could define analyticity more simply in terms of just synonymy of statements together with logical truth; it is not necessary to appeal to synonymy of linguistic forms other than statements. For a statement may be described as analytic simply when it is synonymous with a logically true statement.

So, if the verification theory can be adopted an adequate account of statements, synonymy, the notion of analyticity is saved after all. However, let us reflect. Statements synonymy is said to be likeness of method of empirical confirmation or infirmation. Just what are these methods which are to be compared for likeness? What, in other words, is the nature of the relationship between a statement and the experiences which contribute to or detract from its confirmation?

The most naive view of the relationship is that it is one of direct report. This is radical reductionism. Every meaningful statement held to be translatable into a statement (true or false) about immediate experience. Radical reductionism in one form or another, well antedates the verification theory of meaning explicitly so called. Thus Locke and Hume held that every idea must either originate directly in sense experience or else be compounded of ideas thus originating and taking a hint from Tooke’s. We might rephrase this doctrine in semantical jargon by saying that a term, to be significant, must be either a name of a sense datum or a compound of such names or an abbreviation of such a compound. So stated, the doctrine remains ambiguous as between sense data as sensory events and sense data as sensory qualities, and it remains vague as to the admissible ways of compounding. Moreover, the doctrine is unnecessarily and intolerably restrictive in the term-by-term critique which it imposes. More reasonably and without yet exceeding the limits of what I have called radical reductionism we may take full statements as our significant units—thus demanding that our statements as wholes be translatable into sense-datum language but not that they be translatable by term.

Radical reductionism conceived now with statements as units, sets itself the task of specifying a sense-datum language and showing how to translate the rest of significant discourse, statement by statement, into it. Carnap embarked on this project in the Aufbau. It had to await two intermediate developments. One of these developments was the increasing emphasis on verification or confirmation which came with the explicitly so-called verification theory of meaning. The objects of verification or confirmation being statements, this emphasis gave the statement an ascendency over the word or term as unit of significant discourse. The other development consequent upon the first was Russell’s discovery of the concept of incomplete symbols defined in use.

Radical reductionism conceived now with statements as units, sets itself the task of specifying a sense-datum language and showing how to translate the rest of significant discourse, statement by statement into it. Carnap embarked on this project in the Aufbau.

The language which Carnap adopted as his starting point was not a sense-datum language in the narrowest conceivable sense, for it included also the notation of logic, up through higher set theory. In effect it included the whole language of pure mathematics. The ontology implicit in it (i.e., the range of values of its variables) embraced not only sensory events but classes, classes of classes, and so on. Empiricists there are who would boggle at such prodigality. Carnap’s starting point is very parsimonious however in its extralogical sensory part. In a series of constructions in which he exploits the resources of modern logic with much ingenuity, Carnap succeeds in defining a wide array of important additional sensory concepts which, but for his constructions one would not have dreamed were definable in so slender a basis. Carnap was the first empiricist who, not content with asserting the reducibility of science to terms of immediate experience took serious steps toward carrying out the reduction.

Even supposing Carnap’s starting point satisfactory, his constructions were, as he himself stressed, only a fragment of the full program. The construction of even the simplest statements about the physical world was left in a sketchy state. Carnap’s suggestions on this subject were, despite their sketchiness, very suggestive. He explained spatial-temporal point-instants as quadruples of real numbers and envisaged assignment of sense qualities to point-instants according to certain canons. Roughly summarized the plan was that qualities should be assigned to point-instants in such a way as to achieve the laziest world compatible with our experience. The principle of least action was to be our guide in constructing a world from experience.
Carnap did not seem to recognize, however, that his treatment of physical objects fell short of reduction not merely through sketchiness but in principle. Statements of the form 'Quality q is at point-instant (x; y; z; t)' were, according to his canons, to be apportioned truth values in such a way as to maximize and minimize certain over-all features, and with growth of experience the truth values were to be progressively revised in the same spirit. I think this is a good schematization (deliberately oversimplified to be sure) of what science really does; but it provides no indication not even the sketchiest of how a statement of the form 'Quality q is at point-instant (x; y; z; t)' could ever be translated into Carnap's initial language of sense data and logic. The connective 'is at' remains an added undefined connective the canons counsel us in its use but not in its elimination.

Carnap seems to have appreciated this point afterward for in his later writings he abandoned all notion of the translatability of statements about the physical world into statements about immediate experience. Reductionism in its radical form has long since ceased to figure in Carnap's philosophy.

But the dogma of reductionism has, in a subtler and more tenuous form, continued to influence the thought of empiricists. The notion lingers that to each statement or each synthetic statement there is associated a unique range of possible sensory events such that the occurrence of any of them would add to the likelihood of truth of the statement and that there is associated also another unique range of possible sensory events whose occurrence would detract from that likelihood. This notion is of course implicit in the verification theory of meaning.

The dogma of reductionism even in its attenuated form is intimately connected with the other dogma: that there is a cleavage between the analytic and the synthetic. We have found ourselves, indeed, from the latter problem to the former through the verification theory of meaning. More directly, the one dogma clearly supports the other in this way: as long as it is taken to be significant in general to speak of the confirmation and infirmation of a statement it seems significant to speak also of a limiting kind of statement which is vacuously confirmed, ipso facto, come what may, and such a statement is analytic.

The two dogmas are, indeed, at root identical. We lately reflected that in general the truth of statements does obviously depend both upon extra-linguistic fact and we noted that this obvious circumstance carries in its train, not logically but all too naturally, a feeling that the truth of a statement is somehow analyzable into a linguistic component and a factual component. The factual component must, if we are empiricists, boil down to a range of confirmatory experiences in the extreme case where the linguistic component is all that matters; true statements analytic. But I hope we are now impressed with how stubbornly the distinction between analytic and synthetic has resisted any straightforward drawing. I am impressed also, apart from prefabricated examples of black and white balls in an urn, with how baffling the problem has always been of arriving at any explicit theory of the empirical confirmation of a synthetic statement. My present suggestion is that it is nonsense, and the root of much nonsense, to speak of a linguistic component individually but only as a corporate body.

The dogma of reductionism survives in the supposition that each statement taken in isolation from its fellows can admit of confirmation or infirmation at all. My countersuggestion issuing essentially from Carnap's doctrine of the physical world in the *Aufbau* is that our statements about the external world face the tribunal of sense experience not individually but only as a corporate body. 17b

The dogma of reductionism even in its attenuated form is intimately connected with the other dogma: that there is a cleavage between the analytic and the synthetic. We have found ourselves, indeed, from the latter problem to the former through the verification theory of meaning. More directly, the one dogma clearly supports the other in this way: as long as it is taken to be significant in general to speak of the confirmation and infirmation of a statement it seems significant to speak also of a limiting kind of statement which is vacuously confirmed, ipso facto, come what may, and such a statement is analytic.

The two dogmas are, indeed, at root identical. We lately reflected that in general the truth of statements does obviously depend both upon extra-linguistic fact; and we noted that this obvious circumstance carries in its train, not logically but all too naturally, a feeling that the truth of a statement is somehow analyzable into a linguistic component and a factual component. The factual component must, if we are empiricists, boil down to a range of confirmatory experiences in the extreme case where the linguistic component is all that matters; true statements analytic. But I hope we are now impressed with how stubbornly the distinction between analytic and synthetic has resisted any straightforward drawing. I am impressed also, apart from prefabricated examples of black and white balls in an urn, with how baffling the problem has always been of arriving at any explicit theory of the empirical confirmation of a synthetic statement. My present suggestion is that it is nonsense, and the root of much nonsense, to speak of a linguistic component and a factual component in the truth of any individual statement. Taken collectively science has its double dependence upon language and experience but this duality is not significantly traceable into the statements of science taken one by one.

But what I am now urging is that even in taking the statements as units we have drawn our grid too finely. The unit of empirical significance is the whole of science.

**VI. EMPIRICISM WITHOUT THE DOGMAS**

The totality of our so-called knowledge or beliefs, from the most casual matters of geography and history to the profoundest laws of atomic physics or even of pure mathematics and logic, is a man-made fabric which impinges on experience only along the edges. Or, to change the figure, total science is like a field of force whose boundary conditions are experience; a conflict with experience at the periphery occasions readjustments in the interior of the field. Truth values have to be redistributed over some of our statements; re-evaluation of some statements entails re-evaluation of others, because of their logical interconnections—the logical laws being in turn simply certain further statements of the system certain further elements of the field. Having re-evaluated one statement we must re-evaluate some others, whether they be statements logically connected with the first or whether they be the statements of logical connections themselves. But the total field is so undetermined by its boundary conditions experience that there is much latitude of choice as to what statements to re-evaluate in the light of any single contrary experience. No particular experiences are linked with any particular statements in the interior of the field, except indirectly through considerations of equilibrium affecting the field as a whole.

If this view is right, it is misleading to speak of the empirical content of an individual statement—especially if it be a statement all remote from the experiential periphery of the field. Furthermore it becomes folly to seek a boundary between synthetic statements which hold contingently on experience and analytic statements which hold come what may. Any statement can be held true come what may, if we make drastic enough adjustments elsewhere in the system. Even a statement very close to the periphery can be held true in the face of recalcitrant experience by pleading hallucination or
by amending certain statements of the kind called logical laws. Conversely by the same token, no statement is immune to revision. Revision even of the logical law of the excluded middle has been proposed as a means of simplifying quantum mechanics and what differences there in principle between such a shift and the shift whereby Kepler superseded Ptolemy, or Einstein Newton, or Darwin Aristotle?

For vividness I have been speaking in terms of varying distances from a sensory periphery. Let me try now to clarify this notion without metaphor. Certain statements though about physical objects and not sense experience seem peculiarly germane to sense experience -- and in a selective way: some statements to some experiences others to others. Such statements especially germane to particular experiences I picture as near the periphery. But in this relation of "germaneness" I envisage nothing more than a loose association reflecting the relative likelihood, in practice of our choosing one statement rather than another for revision in the event of recalcitrant experience. For example, we can imagine recalcitrant experiences to which we would surely be inclined to accommodate our system by re-evaluating just the statement that there are brick houses on Elm Street, together with related statements on the same topic. We can imagine other recalcitrant experiences to which we would be inclined to accommodate our system by re-evaluating just the statement that there are no centaurs along with kindred statements. A recalcitrant experience, I have already urged, be accommodated by any of various alternative evaluations in various alternative quarters of the total system; but, in the cases which we are now imagining, our natural tendency to disturb the total system as little as possible would lead us to focus our revisions upon these specific statements concerning brick houses or centaurs. These statements are felt, therefore, to have a sharper empirical reference than highly theoretical statements of physics or logic or ontology. The latter statements may be thought of as relatively centrally located within the total network meaning merely that little preferential connection with any particular sense data obtrudes itself.

As an empiricist I continue to think of the conceptual scheme of science as a tool, ultimately, for predicting future experience in the light of past experience. Physical objects are conceptually imported into the situation as convenient intermediaries-- not by definition in terms of experience but simply as irreducible posits comparable epistemologically to the gods of Homer. Let me interject that for my part I do, qua lay physicist, believe in physical objects and not in Homer's gods; and I consider it a scientific error to believe otherwise. But in point of epistemological footing the physical objects and the gods differ only in degree and not in kind. Both sorts of entities enter our conception only as cultural posits. The myth of physical objects is epistemologically superior to most in that it has proved more efficacious than other myths as a device for working a manageable structure into the flux of experience.

(1951)

Imagine, for the sake of analogy, that we are given the rational numbers. We develop an algebraic theory for reasoning about them, but we find it inconveniently complex, because certain functions such as square root lack values for some arguments. Then it is discovered that the rules of our algebra can be much simplified by conceptually augmenting our ontology with some mythical entities, to be called irrational numbers. All we continue to be really interested, first and last, are rational numbers but we find that we can commonly get from one law about rational numbers to another much more quickly and simply by pretending that the irrational numbers are there too.

I think this a fair account of the introduction of irrational numbers and other extensions of the number system. The fact that the mythical status of irrational numbers eventually gave way to the Dedekind-Russell version of them as certain infinite classes of ratios is irrelevant to my analogy. That version is impossible anyway as long as reality is limited to the rational numbers and not extended to classes of them.

Now I suggest that experiences are analogous to the rational numbers and that the physical objects, in analogy to the irrational numbers, are posits which serve merely to simplify our treatment of experience. The physical objects are no more reducible to experience than the irrational numbers to rational numbers, but their incorporation into the theory enables us to get more easily from one statement about experiences to another.

The salient differences between the positing of physical objects and the positing of irrational numbers are, I think, just two. First, the factor of simplification is more overwhelming in the case of physical objects than in the numerical case. Second, the positing of physical objects is far more archaic, being indeed coeval, I expect, with language itself. For languages are social and so depends for its development upon intersubjective reference.
Positing does not stop with macroscopic physical objects. Objects at the atomic level and beyond are posited to make the laws of macroscopic objects, and ultimately the laws of experience simpler and more manageable, and we need not expect or demand full definition of atomic and subatomic entities in terms of macroscopic ones, any more than definition of macroscopic things in terms of sense data. Science is a continuation of common sense, and it continues the common-sense expedient of swelling ontology to simplify theory.

Physical objects, small and large, are not the only posits. Forces are another example; and indeed we are told nowadays that the boundary between energy and matter is obsolete. Moreover the abstract entities which are the substance of mathematics—ultimately classes and classes of classes and so on up—are another posit in the same spirit. Epistemologically these are myths on the same footing with physical objects and gods, neither better nor worse except for differences in the degree to which they expedite our dealings with sense experiences.

The over-all algebra of rational and irrational numbers is underdetermined by the algebra of rational numbers, but is smoother and more convenient and it includes the algebra of rational numbers as a jagged or gerrymandered part.

Total science, mathematical and human, is similarly but more extremely underdetermined by experience. The edge of the system must be kept squared with experience, the rest, with all its elaborately myths or fictions, has as its objective the simplicity of laws.

Ontological questions under this view, are on a par with questions of natural science. Consider the question whether to countenance classes as entities. This, as I have argued elsewhere, is the question whether to quantify with respect to variables which take classes as values. Now Carnap ["Empiricism, semantics, and ontology," Revue internationale de philosophie 4 (1950), 20-40.] has maintained that this is a question not of matters of fact but of choosing a convenient language form, a convenient conceptual scheme or framework for science. With this I agree, but only on the proviso that the same be conceded regarding scientific hypotheses generally Carnap has recognized that he is able to preserve a double standard for ontological questions and scientifically only by assuming an absolute distinction between the analytic and the synthetic and I need not say again that this is a distinction which I reject.

Some issues do, I grant, seem more a question of convenient conceptual scheme and others more a question of brute fact. (1951)

The issue over there being classes seems more a question of convenient conceptual scheme, the issue over there being centauroy or brick houses on Elm Street seems more a question of fact. But I have been urging that this difference is only one of degree, and that it turns upon our vaguely pragmatic inclination to adjust one strand of the fabric of science rather than another in accommodating some particular recalculating experience Conservatism figures in such choices, and so does the quest for simplicity.

Carnap, Lewis, and others take a pragmatic stand on the question of choosing between language forms, scientific frameworks but their pragmatism leaves off at the imagined boundary between the analytic and the synthetic. In repudiating such a boundary I espouse a more thorough pragmatism. Each man is given a scientific heritage plus a continuing barrage of sensory stimulation and the considerations which guide him in warping his scientific heritage is, where rational, pragmatic.

Notes

1a. Much of this paper is devoted to a critique of analyticity which I have been urging orally and in correspondence for years past. My debt to the other participants those discussions notably Carnap, Church, Goodman, Tarski, and White, is large and indeterminate. White's excellent essay "The Analytic and the Synthetic An Untenable Dualism," in John Dewey: Philosopher of Science and Freedom (New York, 1950), says much of what needed to be said on the topic; but in the present paper I touch on some further aspects of the problem. I am grateful to Dr. Donald L. Davidson for valuable criticism of the first draft.

4a. This is cognitive synonymy in a primary, broad sense. Carnap (Meaning and Necessity, pp. 56 ff.) and Lewis (Analysis of Knowledge and Valuation [La Salle, Ill., 1946], pp. 83 ff.) have suggested how, once this notion is at hand, a narrower sense of cognitive synonymy which is preferable for some purposes can in turn be derived. But this special ramifications of concept-building lies aside from the present purposes and must not be confused with the broad sort of cognitive synonymy here concerned.

5a. See, for example, my *Mathematical Logic* (New York, 1949; Cambridge Mass., 1947), sec. 24, 26, 27; or *Method of Logic* (New York, 1950), sec. 37 ff.

5b. According to an important variant sense of ‘definition’, the relation preserved may be the weaker relation of mere agreement in reference see "Notes on the Theory of Reference" p. 132. But, definition in this sense is better ignored in the present connection being irrelevant to the question of synonymy.

7a. The doctrine can indeed be formulated with terms rather than statements as the units. Thus C. I. Lewis describes the meaning of a term as "a criterion in mind, by reference to which one is able to apply or refuse to apply the expression in question in the case of presented or imagined things or situations" (Carnap, *Meaning and Necessity*, p. 133.).

7b. This is cognitive synonymy in a primary, broad sense. Carnap (*Meaning and Necessity*, pp. 56 ff) and Lewis (*Analysis of Knowledge and Valuation* [La Salle, Ill., 1946], pp. 83 ff) have suggested how, once this notion is at hand, a narrower sense of cognitive synonymy which is preferable for some purposes can in turn be derived. But this special ramification of concept-building lies aside from the present purposes and must not be confused with the broad sort of cognitive synonymy here concerned.
