# Computable General Equilibrium (CGE) Models: A Short Course 

Hodjat Ghadimi<br>Regional Research Institute<br>WWMWV.RRI. WMYU.EDU

Spring 2007

## Sessjon Twor specl flcation

## Session 2: Specijication

$\lrcorner$ A taxonomy of models
$\lrcorner$ Components of a simple CGE
$\lrcorner$ Mathematical model statement

## Review: CGE Keywords

$\lrcorner$ Multisectoral
$\lrcorner$ Nonlinear

- Economy-wide
$\lrcorner$ Autonomous decision making
- Walrasian competitive equilibrium

## Structure of a CGE model

## Circular Flow of Income

## A taxonomy of models

## Models and Policy Analysis

Policy makers intend to change the way the economy operates, rather than just understand it
$\lrcorner$ Policy analysis: explain the links between instruments and targets

- Model-building: the process of abstraction and generalization required to provide structure to our empirical observation

## Economic Models

$\lrcorner$ Analytic models

- Stylized numerical models

Applied models

## Complex Real World

Conceptual Model (Stylized facts)

Stylized Model

Applied Model

Apply theoretical framework \& statistical methods to filter out inessential details

Focus on important assumptions \&causal mechanisms

Attach numbers to the variables \& relate them to economic performance

Include more details, more specific

## Complex Real World

> Conceptual Model (Stylized facts)

Stylized Model

Applied Model

Description of reality

## Strategic Policy Analysis

Detailed Policy Analysis

## Analytic models

Cast economic relationships into a form susceptible to mathematical analysis
$\lrcorner$ Explore the implications of various sets of postulates

- Delliberately simplified to focus on important assumptions and causal mechanisms
- Empirical realism not an important criterion

## Stylized numerical models

$\lrcorner$ Attach numbers to the variables and relate them to economic statistics

- Larger, more complex \& more realistic
$\lrcorner$ Used to analyze problems too difficult to solve analytically
Empirical, able to explore the size of various effects
Give up simplicity to gain in applicability \& generality

## Applied models

$\lrcorner$ I nclude broader range of stylized facts
$\lrcorner$ More specific and narrow in application
$\lrcorner$ Include more institutional details
$\lrcorner$ Additional details may obscure the major causal mechanisms without adding any empirically significant effects

- CGE models fall into both stylized and applied categories
I In addition CGE models:
- Have strong links with basic economic theory

Work by simulating the interaction of various actors as specififed in neoclassical generalequilibrium theory

- Derive "behavior" based on optimization as specified in micro-theory
- Are fully "closed" in that the supply and demand sides of all markets are specified

## Components of a simple CGE

## See a SAM structure

## Mathematical model statement

- 123 Model
- Graphical Analysis
$\lrcorner$ Equations of an applied model

## 1-2-3 Model

Capture mechanisms by which external shocks and domestic policies ripple through the economy
$\lrcorner$ Many problems (and solutions) are related to links between external sectors and domestic economy
Based on: Devarajan-Go-Lewis-RonbinsonSinko (1997)

## 1-2-3 ModeJ

1 country, 2 activities, 3 commodities
$\perp 2$ activities, producing D and E.
E not consumed domestically.
$\lrcorner$ Additional commodity, M, consumed domestically but not produced.

## 1-2-3 Model

$\lrcorner$ Very simplistic stylized model, but:

- Mechanisms are transparent
- Can be solved graphically, analytically, or with Excel
- Behavior is similar to that of more complex models

## 1-2-3 Model

$\lrcorner$ Aggregate GDP $(X)$ is fixed.

- Full employment model.
-Trade balance set exogenously.
- World prices of $M$ and E are fixed.
- Total absorption (Q) is endogenous.

## Basic 1-2-3 CGE Model

$$
\begin{aligned}
& \text { Flows } \\
& \text { 1. } \bar{X}=G\left(E, D^{S} ; \Omega\right) \\
& \text { 2. } Q^{S}=F\left(M, D^{D} ; \sigma\right) \\
& \text { 3. } Q^{D}=\frac{Y}{P^{q}} \\
& \text { 4. } \frac{E}{D^{S}}=g_{2}\left(P^{e}, P^{d}\right) \\
& \text { 5. } \frac{M}{D^{D}}=f_{2}\left(P^{m}, P^{d}\right) \\
& \text { 6. } Y=P^{x} \square \bar{X}+R \square B
\end{aligned}
$$

## Prices

7. $P^{m}=R \square p w^{m}$
8. $P^{e}=R \square p w^{e}$
9. $P^{x}=g_{1}\left(P^{e}, P^{d}\right)$
10. $P^{q}=f_{1}\left(P^{m}, P^{d}\right)$
11. $R \equiv 1$

Equilibrium Conditions
12. $D^{D}-D^{S}=0$
13. $Q^{D}-Q^{S}=0$
14. $p w^{m} \square M-p w^{e} \square E=B$

## Basic 1-2-3 CGE Model

$$
\begin{aligned}
& \text { Identities } \\
& \text { 15. } P^{x} \sqcap X \equiv P^{e} \sqsubset E+P^{d} D^{s} \\
& \text { 16. } P^{q} \sqcap Q^{s} \equiv P^{m} \sqcap M+P^{d} \sqcap D^{D} \\
& \text { 17. } Y \equiv P^{q} \square Q^{D}
\end{aligned}
$$

## Basic 1-2-3 CGE Model

## Endogenous Variables

E: Export good
M: I mport good
Ds: Supply of domestic good
DP: Demand for domestic good
Qs: Supply of composite good
QP: Demand for composite good
Y: Total income
pe: Domestic price of export good
Pm: Domestic price of import good
pd: Domestic price of domestic good
px: Price of aggregate output
pa: Price of composite good
R: Exchange rate

## Exogenous Variables

pwe: world price of export good
pwim: world price of import good
B: Balance of trade
$\sigma:$ I mport substitution elasticity
Q: Export transformation elasticity

## SAM for 1-2-3 Model

|  | Activities | Commod | Hshld | World |
| :--- | :---: | :---: | :---: | :---: |
| Activities |  | $P^{d} \square D^{D}$ |  | $P^{e} \square E$ |
| Commodities |  |  | $P^{q} \square Q^{D}$ |  |
| Households | $P^{x} \square \bar{X}$ |  |  | $R \square B$ |
| World |  | $P^{m} \square M$ |  |  |
| Total | $P^{d} \square D^{S}+P^{e} \square E$ | $P^{q} \square Q^{S}$ | Y |  |

## Mathenatical model statement

$$
E / D=k\left(P_{E} / P_{D}\right)^{\Omega}
$$

$\mathrm{P}_{\mathrm{E}}=$ R•pwe

D

## Mathenatical model statement

$$
\begin{gathered}
M / D=K^{\prime}\left(P_{D} / P_{M}\right)^{\sigma} \\
P_{M}=R \cdot p w m
\end{gathered}
$$

## 1-2-3 Programming Model

Maximize $Q=F(M, D ; \sigma)$
with respect to: $M, E, D^{D}, D^{S}$
subject to:

# Shadow Prices 

$$
\begin{array}{lcl}
\text { 1. } G\left(E, D^{S} ; \Omega\right) \leq \bar{X} & \text { technology } & \lambda^{x}=P^{x} / P^{q} \\
\text { 2. } p w^{m} \cdot M \leq p w^{e} \cdot E+\bar{B} & \text { balance of trade } & \lambda^{b}=R / P^{q} \\
\text { 3. } D^{D} \leq D^{s} & \text { domestic market } & \lambda^{d}=P^{d} / P^{q}
\end{array}
$$

Sherman Robinson
Pekka Sinko

## 1-2-3 CGE Model

## Real Flows

$$
\begin{aligned}
& \text { 1. } \bar{X}=G\left(E, D^{S} ; \Omega\right) \\
& \text { 2. } Q^{S}=F\left(M, D^{D} ; \sigma\right) \\
& \text { 3. } Q^{D}=C+Z+G \\
& \text { 4. } \frac{E}{D^{S}}=g_{2}\left(P^{e}, P^{d}\right) \\
& \text { 5. } \frac{M}{D^{D}}=f_{2}\left(P^{m}, P^{d}\right)
\end{aligned}
$$

## 1-2-3 CGE ModeJ

$$
\text { 6. } \begin{aligned}
T & =t^{m} \sqcap R \square p w^{m} \square M \\
& +t^{q} \square P^{q} Q^{D} \\
& +t^{y} \square Y \\
& +t^{e} \sqcap P^{e} \square E \\
\text { 7. } Y & =P^{x} \square X+t r \square P^{q}+r e \llbracket R \\
\text { 8. } S & =\bar{s} \square+R \square \bar{B}+S^{g} \\
\text { 9. } C & \square P^{t}=\left(1-\bar{s}-t^{y}\right) Y
\end{aligned}
$$

## 1-2-3 CGE Model

## Prices

$$
\begin{aligned}
& \text { 10. } P^{m}=\left(1+t^{m}\right) \backslash R \square p w^{m} \\
& \text { 11. } P^{e} \sqsubset\left(1+t^{e}\right)=R \square p w^{e} \\
& \text { 12. } P^{t}=\left(1+t^{q}\right) \backslash P^{q}
\end{aligned}
$$

$$
\text { 13. } P^{x}=g_{1}\left(P^{e}, P^{d}\right)
$$

$$
\text { 14. } P^{q}=f_{1}\left(P^{m}, P^{d}\right)
$$

15. $R \equiv 1$

## 1-2-3 CGE Model

$$
\begin{aligned}
& \text { Equilibrium Conditions } \\
& \text { 16. } D^{D}-D^{S}=0 \\
& \text { 17. } Q^{D}-Q^{S}=0 \\
& \text { 18. } p w^{m} \square M-p w^{e} \square E-f t-r e=B \\
& \text { 19. } P^{t} \square Z-S=0 \\
& \text { 20. } T-P^{q} \sqcap \bar{G}-\operatorname{tr} \square P^{q}+f t \square R-S^{g}=0
\end{aligned}
$$

## 1-2-3 CGE ModeJ

## Identities <br> $$
\text { 21. } P^{x} \square X \equiv P^{e} \square E+P^{d} \square D^{S}
$$ <br> $$
\text { 22. } P^{q}\left[Q ^ { S } \equiv P ^ { m } \left[M+P^{d} \square D^{D}\right.\right.
$$

## Mathenarical noodel statennent

## Endogenous Variables

E: Export good
M: Import good
$\mathrm{D}^{\text {S }}$ : Supply of domestic good
$\mathrm{D}^{\mathrm{D}}$ : Demand for domestic good
$\mathrm{Q}^{\mathrm{S}}$ : Supply of composite good
$Q^{\text {D }}$ : Demand for composite good
$\mathrm{P}^{\mathrm{e}}$ : Domestic price of export good
$\mathrm{P}^{\mathrm{m}}$ : Domestic price of import good
$\mathrm{P}^{\mathrm{d}}$ : Domestic price of domestic good
$\mathrm{P}^{\mathrm{x}}$ : Price of aggregate output
$\mathrm{P}^{\mathrm{q}}$ : Price of composite good
$\mathrm{P}^{\mathrm{t}}$ : Sale price of composite good
R: Exchange rate
T: Tax revenue
$S^{\text {g. }}$ Government savings
Y: Total income
C: Aggregate consumption
S: Aggregate savings
Z: Aggregate real investment

## Exogenous Variables

$p w^{\mathrm{e}}$ : world price of export good
$\mathrm{pw}^{\mathrm{m}}$ : world price of import good
$\mathrm{t}^{\mathrm{m}}$ : Tariff rate
$t^{\mathrm{x}}$ : Export tax rate
$\mathrm{t}^{\mathrm{q}}$ : Sales tax rate
$t^{\mathrm{y}}$ : Direct tax rate
tr: Government transfers (real)
ft : Foreign transfers to government
re: Foreign remittances to private sector
s: Average savings rate
X: Aggregate output (GDP)
G: Real government demand
B: Balance of trade
$\sigma$ : Import substitution elasticity
$\Omega$ : Export transformation elasticity
