

# Investigating familial Parkinson's disease using a stem cell model

**6M PARKINSON'S DISEASE PATIENTS  
WORLDWIDE**

**1M PATIENTS IN EUROPE**

**€13.9 BILLION ANNUAL EUROPEAN  
COST**

**BUT... NO CURE, YET**

A photograph of an elderly man walking away from the camera on a sandy beach. He is wearing a white long-sleeved shirt, white shorts, and a white fedora-style hat with a black band. He is leaning on a wooden cane. The background shows the ocean waves and a clear sky.

Both **environmental** and **genetic factors** contribute to Parkinson's disease risk

Most cases are late-onset **idiopathic forms**

Rare **familial forms**: a number of mutations have been identified in several genes that are linked to autosomal dominant or recessive familial forms of the disease: **LRRK2, PINK1, alpha-synuclein SNCA** (point mutations, duplications, triplications)

# Parkinson's Disease

*James Parkinson 'An Essay on the Shaking Palsy', 1817*

Substantia  
Nigra

## **Motor symptoms**

resting tremor, rigidity, bradykinesia and postural instability

## **Non-motor symptoms**

cognitive and sensory disturbances

# Parkinson's Disease

## $\alpha$ Synuclein gene

G209A (**p.A53T**)  $\alpha$ Syn mutation causes a **familial form of PD** characterized by **early onset** and a generally severe phenotype, including **non-motor manifestations** (Polymeropoulos et al, Science 1997)

# Reduced synaptic contacts in A53T-neurons

iPSC-derived neurons seeded on mouse astrocytes for up to 100 days

# Rescue of pathological phenotype by small molecules targeting $\alpha$ Syn

Small molecule inhibitors of  $\alpha$ Syn aggregation (Dr E. Masliah, UCSD)  
*Wrasidlo W, et al., Brain 2016*

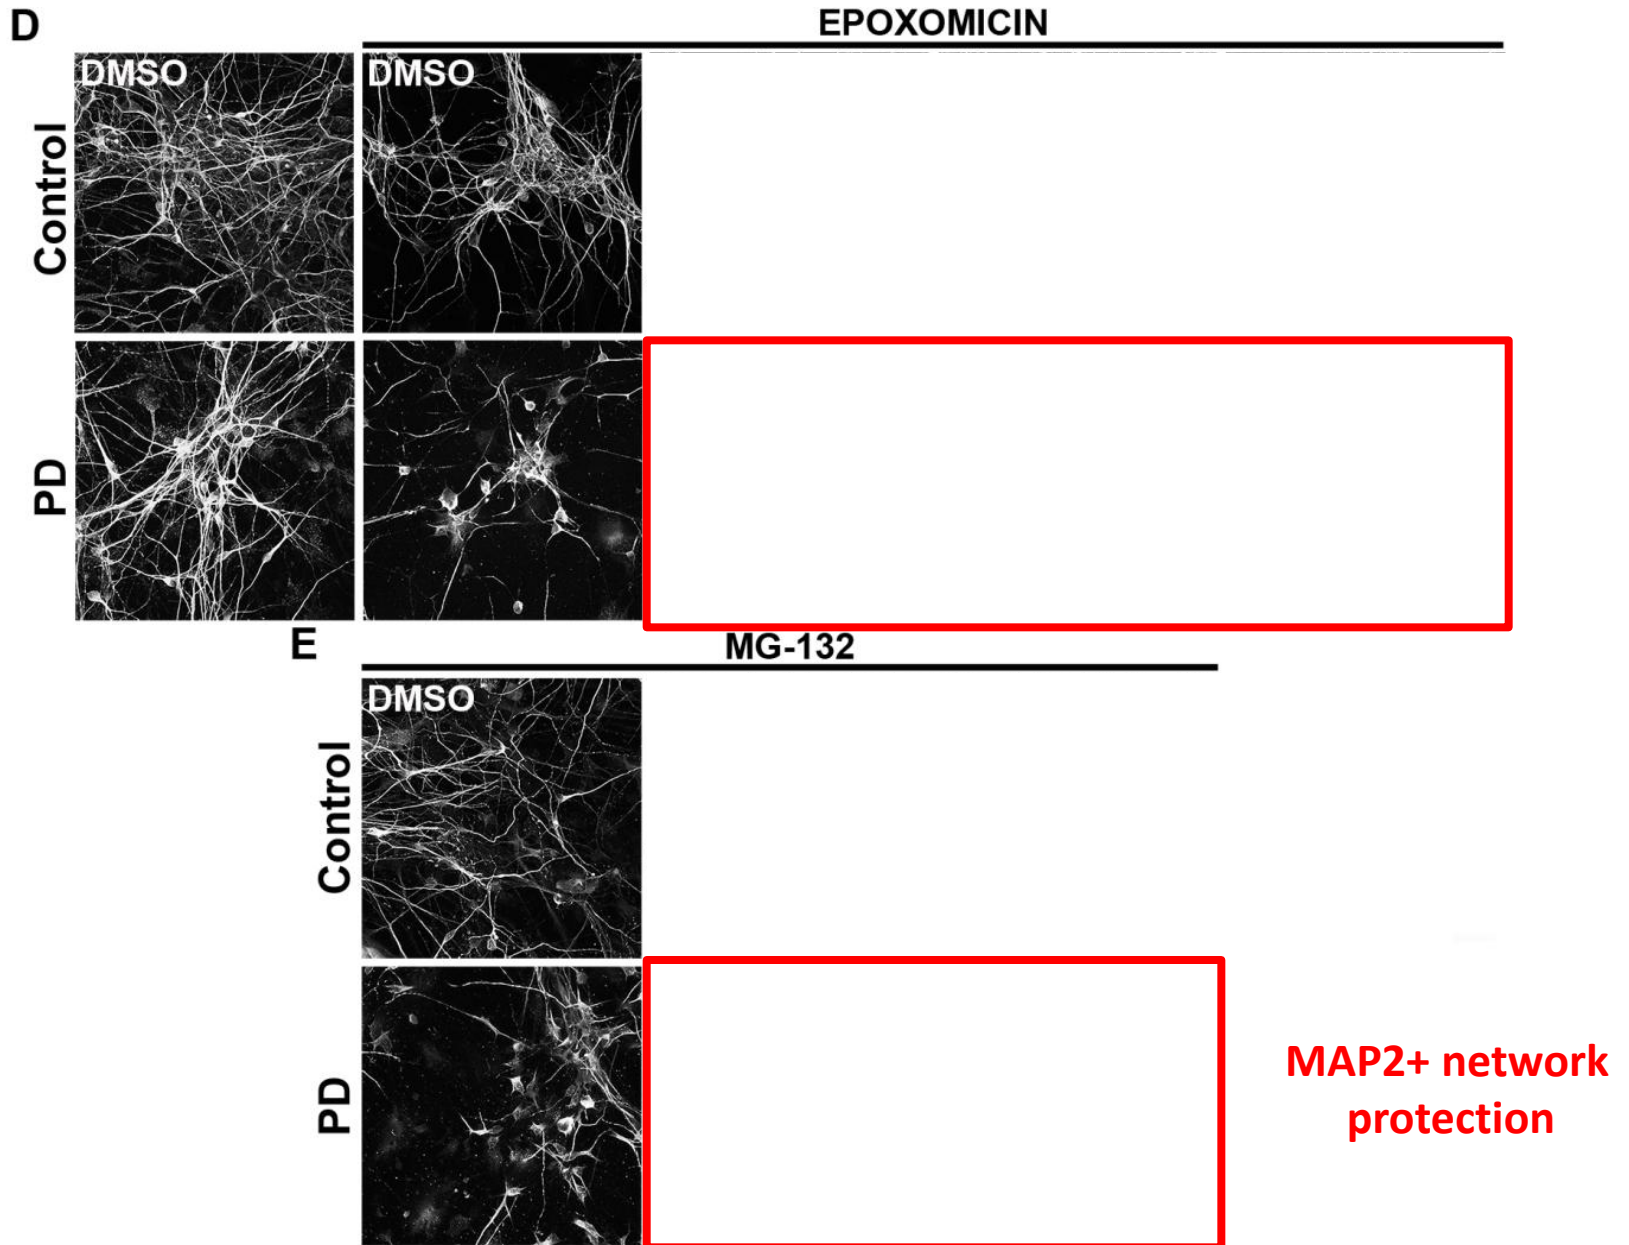

**3. Alleviate significantly the existence of distorted/degenerating axons**

**Are the small molecules effective under induced stress conditions?**

# PD neurons: increased susceptibility to environmental stress conditions

# Reversal of induced-stress phenotypes by small molecules targeting $\alpha$ Syn

# Conclusions

An iPSC-based model that...

1. faithfully simulates disease pathogenesis and uncovers novel disease-relevant phenotypes at basal conditions
  - protein aggregation
  - compromised neuritic outgrowth
  - axonal  $\alpha$ Syn/tau-associated pathology
  - alterations in synaptic molecules
2. highlights a feasible therapeutic approach (protective effects of small-molecule inhibitors of  $\alpha$ Syn aggregation)
3. can be used as a platform to screen disease-modifying drugs
